Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

+ *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.

+ *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.

+ *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.

+ *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página `http://books.google.com`

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

ZURICH INCANDESCENCE LAMP CO.

47, VICTORIA ST., WESTMINSTER, S.W.

Director:

C. H. STEARN,

Joint Inventor with Mr. J. W. SWAN, of the modern Incandescence Lamp.

Lamps delivered by postal packets to all parts of the United Kingdom.

Lamps of Long Duration with larger consumption of power, or of greater economy and Shorter Duration, delivered as required.

Terminals affixed as ordered, to suit any holders of the current types.

The Lamps are manufactured under Mr. STEARN'S Personal Direction by an English Staff.

ALL LAMPS ACCURATELY CLASSIFIED IN VOLTAGE & CANDLE-POWER

The Company are now supplying

STEARN'S NEW CENTRAL STATION LAMPS

at 2·7 watts per candle, "for use where Economy of Current is the first consideration." These Lamps effect a saving of **10s. 2d.** per 1,000 hours on a 16-c.p. Lamp as compared with the ordinary 4-watt Lamps, price of current being 7d. per Board of Trade Unit.

ORDERS FOR LARGE QUANTITIES OF LAMPS PROMPTLY EXECUTED.

JOHNSON & PHILLIPS,

ENGINEERS & ELECTRICIANS,

Contractors to H.M. Post Office, India Office, War Office, the Admiralty, and other Government Departments.

OFFICES:

14, UNION COURT, OLD BROAD STREET, LONDON, E.C.

Works: CHARLTON, KENT.

Telegrams: "JUNO," London. Telephone No. 1,010. Private Wire, City Offices to Works.

MANUFACTURERS

of Telegraph and Electric Light Machinery and Plant of every description, including the following, viz.:—

CABLE MACHINERY: ..... Designed and constructed for making, laying, and maintaining Telegraph Cables, and for the complete Equipment of Cable Factories and Vessels.

CABLE GEAR: .... Iron and Steel Buoys, Grapnels, Centipedes, Creepers, Mushrooms, Sinkers, Cable Tanks and Drums, Splicing and Jointing Tools, &c., &c. Sole Makers of Trott and Hamilton's Patent Grapnel Rope, Trott and Kingsford's Patent Indicating Grapnels, and Gott and Kingsford's Fault Indicator.

SOUNDING MACHINES: ... Steam and Hand Wire Sounding Machines for deep and shallow water.

CABLES: ..... Submarine, Subterranean, Aërial, Torpedo, Field, and Electric Light Cables. Brooks's Patent Underground Mains with Liquid Insulation.

INSULATED WIRES: ..... Vulcanised India Rubber, Gutta Percha, Silk and Cotton covered Wires in all gauges, taped and braided.

LAND LINE MATERIAL:...
- **Poles:** Wrought Iron and Composite Poles of various kinds; House-top Poles and Fittings for Telegraph or Telephone Lines; Telephone Exchange Derricks.
- **Insulators:** Johnson and Phillips's Patent Fluid Insulators, and all other kinds.
- **Wire:** Iron and Steel Wires of all gauges; Insulated Wires of every description.

Estimates given for Complete Telegraph Lines and Fittings for Stations.

TELEPHONE MATERIAL:.. Complete Fittings for Telephone Exchanges.

BATTERIES: ..... Sole Makers of Higgins's Patent Bichromate Batteries; Leclanché, Gravity, &c., &c.; Zinc and Carbon Battery Plates; Accumulators in all sizes, D. P. type with high rate of discharge.

INSTRUMENTS: ..... Morse, Needle, Bells, Galvanometers, and other Testing Instruments, Supply Meters, &c., &c.

ELECTRIC LIGHT: ..... "Kapp" Alternating and Continuous Current Dynamos, Transformers, Lamps, Cables, Carbons, Switches, &c., &c. Sole Makers of the *Brockie-Pell Patent Arc Lamp*, which is *absolutely steady in burning.*

Estimates given for Complete Installations of the Electric Light. Central Stations fitted Complete.

CARBONS: ..... Carbon Plates and Rods of every description, solid or cored, black or coppered.

LIGHTNING CONDUCTORS: Lightning Conductors of the most approved types.

SELIG, SONNENTHAL & CO.,

SOLE LICENSEES OF THE

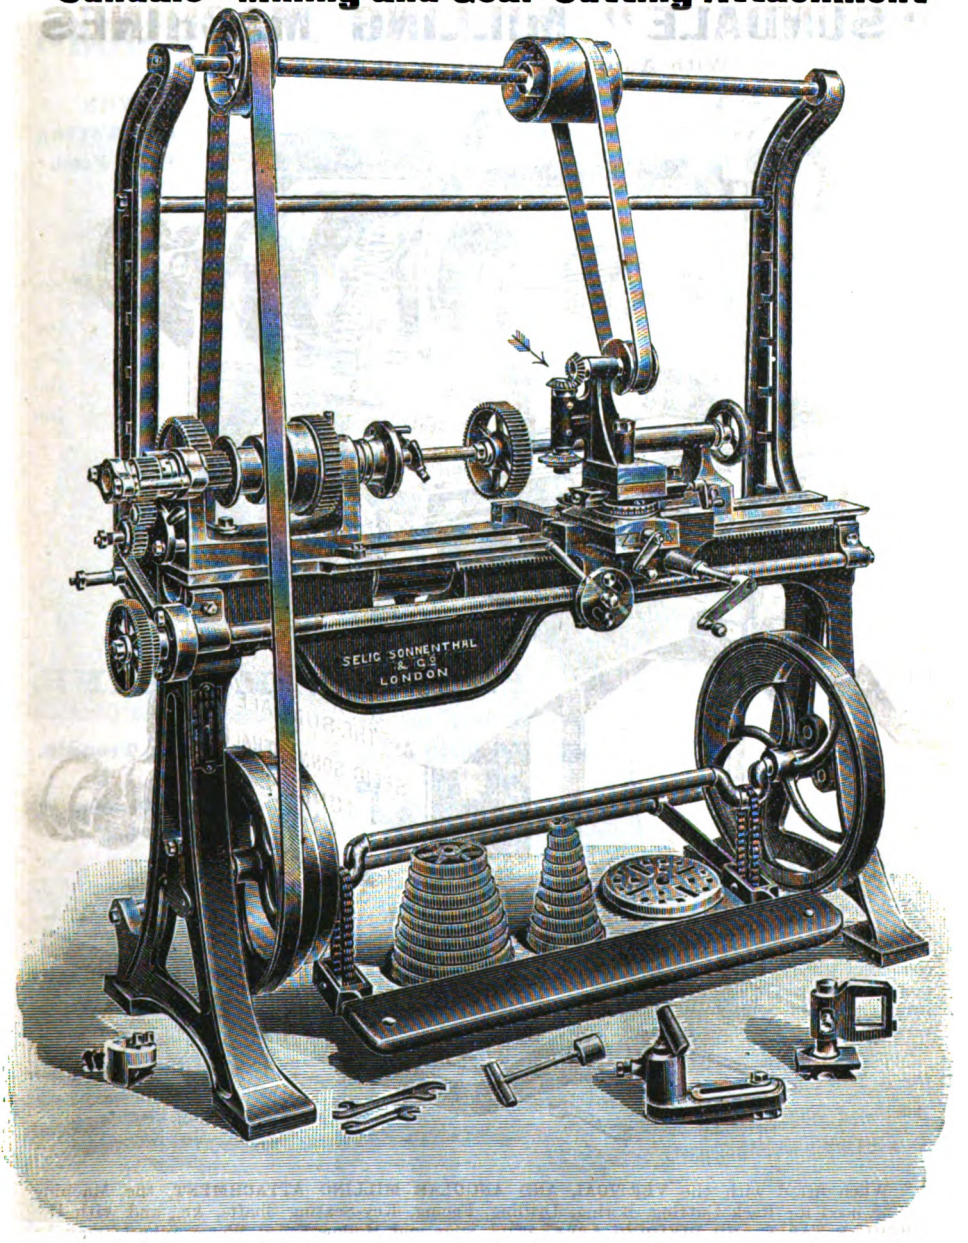
"Sundale" Milling and Gear Cutting Attachment



"VICTORIA" Hollow Spindle Screw Cutting Treadle Lathe with self-contained overhead motion, and "SUNDALE" Gear Cutter.

85, QUEEN VICTORIA STREET, & LAMBETH HILL, LONDON, E.C.

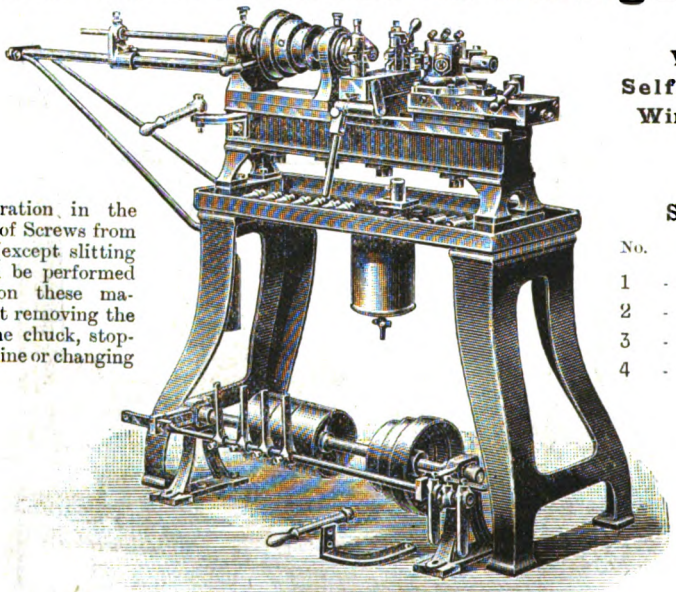
B 2

Digitized by Google

SELIG, SONNENTHAL & CO.,

SOLE LICENSEES OF

"Victoria" Turret-Head Screw-Making Lathe,



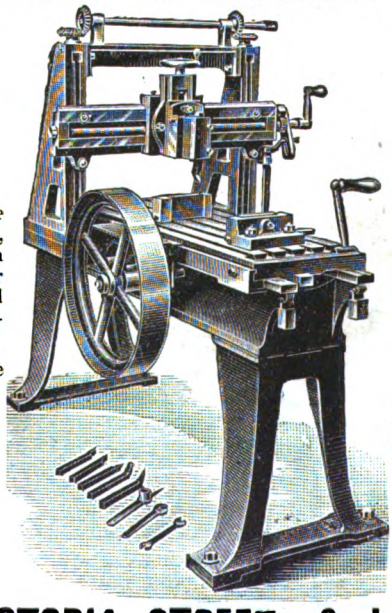
With Self-Acting Wire Feed.

Every operation in the manufacture of Screws from the wire rod (except slitting the head) can be performed successively on these machines without removing the work from the chuck, stopping the machine or changing the tools.

SIZES.

No.	For articles up to
1	⅜in.
2	⅝in.
3	¼in.
4	⅞in.

THE "EUREKA" PLANING MACHINE,



For Hand, Treadle, or Steam Power.

ADVANTAGES.

Works continuously in one direction. Works by treadle, hand or power. Works with one pulley when arranged for power. Work can be stopped instantly, even whilst reversing.

Made in five sizes to plane from

14in. by 9in. by 4in. to
60in. by 32in. by 20-in.

S., S. & Co.,

KEEP IN STOCK READY FOR IMMEDIATE DELIVERY

A large assortment of Lathes. Drilling Machines (Radial. etc.), Milling, Planing, Screwing and other Machine Tools.

85, QUEEN VICTORIA STREET, & LAMBETH HILL, LONDON, E.C.

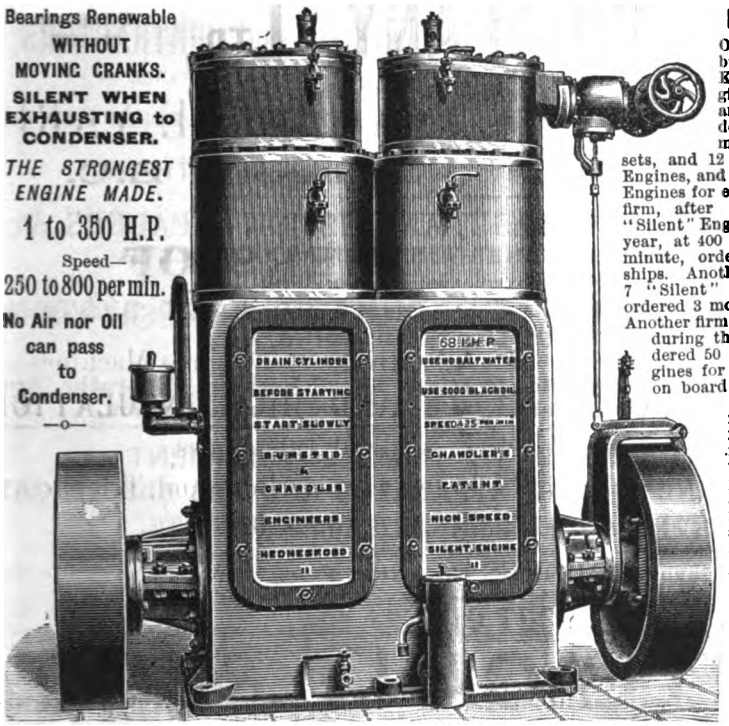
—o—



FOUR YEARS AGO

One of the largest Shipbuilders in the United Kingdom ordered 2 Engines, and after severe and extended trials ordered 14 more, and four months after another 20 sets, and 12 months later 4 more Engines, and up to date many more Engines for electric light. Another firm, after running 10 of these "Silent" Engines in ships for over a year, at 400 to 600 revolutions per minute, ordered 4 more for new ships. Another firm, after running 7 "Silent" Engines for a year, ordered 3 more, and then 5 more. Another firm of Electrical Engineers during the last 4 years have ordered 50 of these "Silent" Engines for coupling to Dynamos on board ships.

Another firm, after running four Engines for 18 months, ordered many larger sets. Another firm, after two years' constant use of 3 Engines, ordered 2 more Engines. The steamers *Teutonic* and *Majestic* each have 17 of these Engines on board for various purposes, these were selected after competitive tests. Over 20 Engines in P. and O. Co.'s ships and 20 British India Co.'s steamers lighted by these Engines.

PRINTING AND PUBLISHING COMPANY

(LIMITED),

1, 2, & 3, SALISBURY COURT, FLEET STREET,

LONDON, E.C.

Publishers, Booksellers, Letterpress Printers,

STATIONERS,

AND

ADVERTISEMENT CONTRACTORS,

&c., &c., &c.

Publishers.—The Company's Premises are extensive, are situate in the centre of the Publishing Trade, and are admirably adapted for the publishing of Newspapers, Books, Magazines, &c. Publishing on Commission or otherwise on the best terms. MSS. of Electrical, Engineering, Chemical, and similar Works purchased (after approval), and every assistance rendered to Authors contemplating publication.

Booksellers, &c.—Orders received for all descriptions of Books and Publications. Daily, weekly, monthly, and quarterly parcels of Books, Magazines, and Newspapers made up for dispatch to the Provinces and Abroad on best terms. Subscriptions received for British and Foreign journals. Sample copies of the chief Foreign Electrical Journals can be seen at the offices.

Printers.—This Company undertake Printing Work of all kinds in the best style, at reasonable prices, and on the shortest notice. A large supply of the most modern Type, Ornaments, &c., is kept, and Customers are provided with A COMPREHENSIVE TYPE SPECIMEN BOOK from which to select. A thoroughly competent technical staff, and FAST MACHINERY, both large and small, suitable for all classes of Newspaper, Book, Commercial, and General Printing. *Specially low quotations for regular quantities and large numbers.*

Book and Pamphlet Binding.—Special facilities offered for paper binding in large quantities, on the Company's premises.

Advertisement Contractors.—Advertisements inserted in the London, Provincial, Colonial, Continental, and American Journals on the very closest terms. Quotations supplied for special positions on short notice. All Advertisements, whether display or otherwise, are put into type free of charge, and submitted for approval before insertion. This is an advantage of the greatest value to Advertisers, as it secures effective display and frequently a considerable saving of space and expense, besides ensuring a uniformity of style and setting for serial advertisements, which is sometimes very important. To large Advertisers this is an indispensable feature. Careful attention given to Applications for Share and Debenture Capital, Drawings of Bonds, Open Contracts, Legal Notices, Auctions, Trade Advertisements (Illustrated and otherwise), &c., &c. *Vouchers furnished for all insertions.*

LECLANCHÉ BATTERIES.

LECLANCHÉ-BARBIER PATENT CYLINDRICAL AGGLOMERATE BATTERIES.

ALSO

AGGLOMERATE BLOCK & POROUS POT BATTERIES.

LECLANCHÉ AGGLOMERATE BLOCKS OF ALL SIZES.

LECLANCHE-BARBIER WET CELL

THE LECLANCHÉ-BARBIER CYLINDRICAL AGGLOMERATE WET CELL is the newest and most efficient form of Leclanché Battery. It is an open cell, all parts being instantly accessible, but so arranged as to render it practically a sealed one with no evaporation or creeping salts.

No. 1.—E.M.F., 1·5 volts; I.R., 0·4 ohms.
No. 2.—E.M.F., 1·5 volts; I.R., 0·8 ohms.

THE LECLANCHÉ-BARBIER CYLINDRICAL AGGLOMERATE DRY CELL has all the advantages of the wet one, with the special feature that not being sealed up (like all other dry batteries), any decrease in its E.M.F. can be at once restored by letting it absorb a little ammoniacal solution. The user can thus constantly maintain its efficiency at a nominal cost.

No. 1.—E.M.F., 1·5 volts; I.R., 0·5 ohms.
No. 2.—E.M.F., 1·5 volts; I.R., 0·6 ohms.

LECLANCHÉ-BARBIER DRY CELL.

KINGZETT'S
SULPHUR FUMIGATING CANDLES

(Patents applied for.)

For the Disinfection of Infected Rooms and Hospital Wards after cases of Cholera, Scarlet Fever, Small Pox and other infectious diseases, and for the Disinfection of Railway Carriages and Trucks, Bedding, Clothing, and Drapery. They may also be usefully employed for destroying Insect Pests and Vermin in Empty Rooms, Kitchens, Sculleries, Stables, Kennels, Poultry Houses, Cellars, &c.

In the past there has always been difficulty and danger attendant upon the ignition of Sulphur for fumigating purposes, but with Kingzett's Sulphur Fumigating Candles they are entirely overcome, the Candles *taking fire immediately that a light is applied to the Cone*, and the combustion steadily proceeds until the whole of the sulphur is consumed.

Kingzett's Sulphur Fumigating Candles are put up in two forms, the prices of which are 6d. and 1s. The 1s. size is provided with a Water Jacket, which not only ensures safety from fire, but in which (by means of the heat that is generated by the burning Sulphur) water vapour is given off in association with the Sulphurous Acid Gas. However efficacious dry Sulphurous Acid may be as a disinfecting agent, it is rendered much more so by being generated in a moist state, because the water vapour condenses on the articles which require to be disinfected, and as the Sulphurous Acid is soluble in water, it is brought thereby into absolute (material) contact with them.

6d. Size.

1s. Size.

"THE ENGINEERING MAGAZINE:"

An American Monthly Periodical having an extensive sale in the United States, and containing popularly-written critical articles on Electrical, Engineering and Social Subjects of European interest by leading American writers.

EUROPEAN AGENT:

GEO. TUCKER, Publisher, "THE ELECTRICIAN" PRINTING & PUBLISHING CO., Limited.

"The Engineering Magazine" can be obtained of all Booksellers, and at the Railway Bookstalls throughout the Kingdom.

Volumes commence in April and October, bound half calf, 10s. 6d.

1, 2, and 3, Salisbury Court, Fleet Street, London, E.C.

"THE ELECTRICIAN" SERIES.

THE

ALTERNATE CURRENT TRANSFORMER

In Theory and Practice.

By J. A. FLEMING, M.A., D.Sc., F.R.S., M.R.I., &c.,

Professor of Electrical Engineering in University College, London.

In Two Vols.

VOL. I.—THE INDUCTION OF ELECTRIC CURRENTS.

FOURTH ISSUE. **500** *pages,* **157** *illustrations. Price* **7s. 6d.**, *post free* **8s.**

SYNOPSIS OF CONTENTS

CHAPTER I.—Introductory.
,, II.—Electro-Magnetic Induction.
,, III.—The Theory of Simple Periodic Currents.
,, IV.—Mutual and Self-Induction.
,, V.—Dynamical Theory of Current Induction.

Opinions of the Press on Vol. I.

"It would be very difficult to pick out from amongst the electrical literature of the past ten years any work which marks, as emphatically as does Dr. Fleming's book, the manner in which the practical problems of the day have compelled electrical engineers to advance in their knowledge of theoretical science. . . . . It is a book which the electrical engineer of the present and of the future alike will read—he of the present, if he can; he of the future, because he must."—*Prof. Silvanus P. Thompson in "The Electrician."*

"Dr. Fleming's book contains an enormous amount of valuable matter . . . . which cannot be got anywhere else in the plain and concise way it is given by Dr. Fleming. It is one of those books every electrician should have."—*Electrical Review.*

"A most important, timely, and valuable book. . . . . The author has earned the thanks of everyone interested in this great branch of electrical investigation and practice."—*Electrical World* (New York).

"The practical importance and interest of the subject treated is so great that there should be little need to urge students and electrical engineers to make themselves acquainted with this book, but I do urge them nevertheless; and they may think it fortunate that Dr. Fleming has managed to find time to issue so instructive and readable and well-timed a volume."—*Dr. Oliver J. Lodge in "Nature."*

VOL. II.—THE UTILISATION OF INDUCED CURRENTS.

SECOND ISSUE. *More than* **600** *pages, and over* **300** *illustrations. Price* **12s. 6d.**, *post free* **13s.**

SYNOPSIS OF CONTENTS.

CHAPTER I.—The Historical Development of the Induction Coil and Transformer.
,, II.—Distribution of Electrical Energy by Transformers.
,, III.—Alternate-Current Electric Stations.
,, IV.—The Construction and Action of Transformers.
,, V.—Further Practical Application of Transformers.

Opinions of the Press on Vol. II.

"In reviewing the first volume of this work nearly two years ago we found much to admire and praise, much to raise high expectations for the volume which was to follow. These expectations have by no means been disappointed. The new volume is in many ways of even greater interest than its predecessor."—*Professor Silvanus P. Thompson in "The Electrician."*

"The book is really a valuable addition to technical literature."—*Industries.*

"A valuable addition to the somewhat meagre literature on a subject which is sure to grow in importance and we congratulate Dr. Fleming on his work."—*The Engineer.*

"Le sujet traité par le Dr. Fleming est un de ceux qui, pour le moment, attirent l'attention générale ; son ouvrage est certainement un des plus importants de la littérature électrique. Tous les problèmes relatifs à l'application des courants alternatifs y sont traites avec une très grande compétence et de plus avec une clarté et avec une précision sans égales. Nous ne pouvons donc que recommander vivement cet ouvrage à l'attention de tous les électriciens."—*La Lumière Electrique.*

"L'ouvrage de M. Fleming est une œuvre vraiment pratique qui doit rendre à l'industrie de grands services par l'amas de renseignements qu'elle contient."—*L'Industrie Electrique.*

"Das Fleming'sche Werk fullt entschieden eine Lucke in der Literatur aus und kann durchaus empfohlen werden."—*Elektrotechnische Zeitschrift.*

"THE ELECTRICIAN" SERIES—(*Continued*).

370 pages, 159 illustrations. Price 10s. 6d., post free 11s.

MAGNETIC INDUCTION IN IRON & OTHER METALS

BY J. A. EWING, M.A., B. Sc., &c.

After an introductory chapter, which attempts to explain the fundamental ideas and the terminology, an account is given of the methods which are usually employed to measure the magnetic quality of metals. Examples are then quoted, showing the results of such measurements for various specimens of iron, steel, nickel, and cobalt. A chapter on Magnetic Hysteresis follows, and then the distinctive features of induction by very weak and by very strong magnetic forces are separately described, with further description of experimental methods, and with additional numerical results. The influence of Temperature and the influence of Stress are next discussed. The conception of the Magnetic Circuit is then explained, and some account is given of experiments which are best elucidated by making use of this essentially modern method of treatment. The book concludes with a chapter on the Molecular Theory of Magnetic Induction; and the opportunity is taken to refer to a number of miscellaneous experimental facts, on which the molecular theory has an evident bearing.

Opinions of the Press.

"Full of novel and important matter, the book is written, with admirable clearness, in a pleasant and easy style. It abounds with references to original memoirs for the benefit of those who may wish to pursue the subject further; and in the form of tables and curves it contains a wealth of data which cannot fail to be of value in the application of the science. It is not too much to say that no student of physics and no practical electrician can afford to be without a copy."—*Mr. Shelford Bidwell in "The Electrician."*

"This is one of the most important books that has appeared this year, and coming from an author of such established reputation it will be looked upon as an undoubted authority upon the important subject of which it treats."—*Electrical World* (New York).

"For some time past the London *Electrician* has been publishing a series of excellent articles from the pen of Prof. J. A. Ewing, whose work on magnetism is generally recognised as classical. These articles, reprinted in book form, are now before us. . . . . The book presents the best *résumé* of this subject extant."—*Electrical Engineer* (New York).

"Das Ewing'sche Werk ist eine der werthvollsten literarischen Erscheinungen der Neuzeit und sollte in der Bibliothek keines Elektrotechnikers fehlen."—*Elektrotechnische Zeitschrift.*

A German Edition is also published, price 8s. 6d.

In Two Volumes—Price: stout paper, 2s., post free 2s. 2d. each; strong cloth covers, 2s. 6d., post free 2s. 9d. each. Single Primers, 3d., post free 3½d.

"THE ELECTRICIAN" PRIMERS.

(FULLY ILLUSTRATED.)

A Series of Helpful Primers on Electrical Subjects for the use of Colleges, Schools, and other Educational and Training Institutions, and for Young Men desirous of entering the Electrical professions.

TABLE OF CONTENTS:

Volume I.—THEORY.

Primer No.

1. The Effects of an Electric Current.
2. Conductors and Insulators.
3. Ohm's Law.
4. Primary Batteries.
5. Arrangement of Batteries.
6. Electrolysis.
7. Secondary Batteries.
8. Lines of Force.
9. Magnets.
10. Electrical Units.
11. The Galvanometer.
12. Electrical Measuring Instruments.
13. The Wheatstone Bridge.
14. The Electrometer.
15. The Induction Coil.
16. Alternating Currents.
17. The Leyden Jar.
18. Influence Machines.
19. Lightning Protectors.
20. Thermopiles.

The object of "The Electrician" Primers is to briefly describe in simple and correct language the present state of electrical knowledge. Each Primer is short and complete in itself, and is devoted to the elucidation of some special point or the description of some special application. Theoretical discussion is as far as possible avoided, the principal facts being stated and made clear by reference to the uses to which they have been put. Both volumes are suited to readers having little previous acquaintance with the subject. The matter is brought up to date, and the illustrations refer to instruments and machinery in actual use at the present time. It is hoped that the Primers will be found of use in Schools, Colleges, and other Educational and Training Establishments, where the want of a somewhat popularly written work on electricity and its industrial applications, published at a popular price, has long been felt; while artizans will find the Primers of great service in enabling them to obtain clear notions of the essential principles underlying the apparatus of which they may be called upon to take charge.

Volume II.—PRACTICE.

Primer No.

21. The Electric Telegraph.
22. Automatic and Duplex Telegraphy.
23. The Laying and Repair of Submarine Cables.
24. Testing Submarine Cables.
25. The Telephone.
26. Dynamos.
27. Motors.
28. Transformers.
29. The Arc Lamp.
30. The Incandescent Lamp
31. Underground Mains.
32. Electric Meters.
33. Electric Light Safety Devices.
34. Systems of Electric Distribution.
35. Electric Transmission of Energy.
36. Electric Traction.
37. Electro-Deposition.
38. Electric Welding.

"THE ELECTRICIAN" SERIES—(*Continued*).

Now ready. Fully Illustrated. Price 7s. 6d., *post free* 8s.

THE INCANDESCENT LAMP AND ITS MANUFACTURE.

By GILBERT S. RAM.

The manufacture of the Incandescent Electric Lamp and the principles underlying it being but little known, except to those actually engaged in the work, and no similar work being existent in any language, it has been thought probable that a book on the subject would be welcomed at the present time by those who are interested therein and have not had the opportunity of studying it for themselves. The Author has, therefore, attempted to impart the information he has acquired in the course of a considerable experience in lamp-making, and to do so with as little mathematical embellishment as possible.

320 *pages*, 155 *Illustrations. Price* 6s. 6d., *post free.*

PRACTICAL NOTES for ELECTRICAL STUDENTS.

LAWS, UNITS, AND SIMPLE MEASURING INSTRUMENTS.

By A. E. KENNELLY AND H. D. WILKINSON, M.I.E.E.

Fully Illustrated. Price 10s. 6d., *post free.*

THE

ART of ELECTROLYTIC SEPARATION of METALS.

(THEORETICAL AND PRACTICAL.)

By DR. GEORGE GORE, LL.D., F.R.S.

Second Edition, price 2s. post free.

ELECTRO-CHEMISTRY.

By DR. GEORGE GORE, LL.D., F.R.S.

NOW READY.—*Nearly 800 pages, specially bound bookwise to lie open,* 7s. 6d., *post free* 7s. 9d., (*abroad*, 8s., *post free*); *large paper edition, with wide margins,* 12s. 6d., *post free* 13s. (*abroad*, 13s. 6d., *post free*).

A POCKET-BOOK OF

ELECTRICAL ENGINEERING FORMULÆ, &c.

By W. GEIPEL AND H. KILGOUR.

With the extension of the heavier branches of Electrical Engineering the need of a publication of the Pocket Book type dealing therewith increases; for while, on one hand, there are many such referring to Mechanical Engineering, and, on the other hand, several which deal with Electrical Rules and Formulæ as more particularly applied to the lighter branches of Electrical Engineering, yet none of these alone suffice for the purposes of what may now be said to be the more numerous body of Electrical Engineering, viz.: those engaged in the application of Electricity to lighting, transmission of power, metallurgy and chemical manufacturing. It is to supply this want that this book has been prepared. The following important subjects (amongst others) are dealt with :—

Units.
Electrical, Mechanical and Thermal Properties of Materials.
Light and Sound.
Gravity.
Beams.
Moments of Inertiæ.
Approximate Formulæ.
The Slide Rule.
Mathematical Tables.
Miscellaneous Tables.
Ventilation and Heating.
Buildings & Foundations.
Water Power.
Fuel and Combustion.
Chimneys and Flues.
Boilers.
Feed-Water Heaters and Economisers.
Boiler and Steam-Pipe Covering.
Boiler Testing.
Steam, Gas, and other Engines.
Condensers and Pumps.
Injectors.
Steam Pipes.
Mechanical Transmitters.
Dynamos and Motors.
Regulators.
Transformers.
Systems of Distribution.
Conductors.
Lightning Protectors.
Arc Lamps.
Incandescence Lamps.
Primary Batteries.
Secondary Batteries.
Electro-Chemistry.
Electro-Metallurgy.
Electric Welding.
Electric Traction.
Mining.
Testing and Measuring Instruments.
Fire Office Rules.
Patent Office Information.
Wiring Tables.

A Prospectus, with Specimen Pages, &c., sent post free on application.

ELECTROMAGNETIC THEORY.

VOL. I.

By OLIVER HEAVISIDE.

This work, though without the formality of a treatise, gives a connected account of the theory of electromagnetism from the Faraday Maxwell point of view, and various developments of the theory. After a short introduction, which is easy to read, the second chapter gives an outline of the electromagnetic connections according to the Author's method of exhibiting the relations in a duplex form, symmetrical with respect to the electric and magnetic sides, a method which is suited for displaying the essential properties and bringing out the true analogies, whilst it is free from the obscurities attending the use of essentially arbitrary potential functions. It is also done in the Author's system of rational units, according to which the strength of a pole is measured by the "number of lines of force" emanating from it, which system clears away the confusion prevailing in the ordinary system. The circuital laws, the stresses and flux of energy are also considered. The equations are usually given in the Author's simple vector algebra, in the same form as in his previous "Electrical Papers." How to work vector analysis is explained in the third chapter, which it is hoped will supply a want at the present time, as there are no treatises suitable for physical mathematics. The elementary foundations are simply explained, and various applications given, mostly electromagnetic. This algebra must not be confounded with Quaternions. The fourth chapter, devoted to the theory of electromagnetic waves, especially plane, is principally descriptive, and of a general nature, describing the propagation of waves in dielectrics and the influence of conductors upon them, as well as the propagation of waves in conducting media. The application to telegraphy and telephony is also considered, and a theory of auxiliary devices. The volume concludes with an Appendix on a gravitational and electromagnetic analogy.

Now Ready. Fully Illustrated. Price 7s. 6d., *post free.*

DRUM ARMATURES AND COMMUTATORS

(THEORY AND PRACTICE).

By F. MARTEN WEYMOUTH.

A complete treatise of the theory, and the different methods of construction of Drum Winding, and also of close-coiled continuous-current Commutators, together with a full résumé of some of the principal points of consideration that are involved in their design.

Price 3s. 6d. post free.

THE STEAM-ENGINE INDICATOR AND INDICATOR DIAGRAMS.

Edited by W. W. BEAUMONT, M.I.C.E., M.I.M.E., &c.

A Practical Treatise on the Steam Engine Indicator and Indicator Diagrams, with Notes on Steam Engine Performances, Expansion of Steam, Behaviour of Steam in Steam Engine Cylinders, and on Gas Engine Diagrams.

Fully illustrated. Price 1/6, *post free* 1s. 9d.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS.

A Practical Guide to the Establishment of a Carbon Manufactory.

Contains the results of several years' experiments and experience in carbon candle-making, and gives full particulars, with many illustrations, of the whole process.

In Preparation, fully illustrated.

SUBMARINE CABLE-LAYING & REPAIRING.

By H. D. WILKINSON, M.I.E.E., &c., &c.

This work will describe the procedure on board ship when removing a fault or break in a submerged cable and the mechanical gear used in different vessels for this purpose; and considers the best and most recent practice as regards the electrical tests in use for the detection and localisation of faults, and the various difficulties that occur to the beginner.

In preparation.

ELECTRIC MOTIVE POWER.

By ALBION T. SNELL, Assoc.M.Inst.C.E., M.I.E.E.

The rapid spread of electrical work in collieries, mines, and elsewhere has caused a demand for a practical book on the subject of transmission of power. Though much has been written, there is no single work dealing with the question in a sufficiently comprehensive and yet practical manner to be of real use to the mechanical or mining engineer; either the treatment is adapted for specialists, or it is fragmentary, and power work is regarded as subservient to the question of lighting. The Author has felt the want of such a book in dealing with his clients and others, and in "Electric Motive Power" is endeavouring to supply it.

"THE ELECTRICIAN" SERIES—*(Continued).*

Price 2s. 6d., post free (U.K.)

DIGEST OF THE LAW OF ELECTRIC LIGHTING.

By A. C. CURTIS HAYWARD, B.A., A.I.E.E.

An abstract of the Electric Lighting Acts, 1882 and 1889, and of the various documents emanating from the Board of Trade dealing with electric lighting. The digest treats first of the manner in which persons desirous of supplying electricity must set to work, and then of their rights and obligations after obtaining Parliamentary powers; and gives in a succinct form information of great value to Local Authorities, Electric Light Contractors, &c.

In Preparation.

MOTIVE POWER AND GEARING

FOR ELECTRICAL ENGINEERS.

FINE ART REPRODUCTIONS.

NOW READY.—Price **£1. 1s.**, *in Sepia or Black; in Special Frame,* **£2. 2s.**

A Handsome Plate Reproduction of Robert Dudley's famous Painting of

THE "GREAT EASTERN."

(By permission of the Executors of the late Sir James Anderson.)

The first of a series of Fine Art Plates which it is proposed to issue from time to time, and executed in the best style, and by the latest and best process of faithful reproduction. The Plate has a high historic value; it portrays the great ship at the critical moment when, in endeavouring to pick up the 1865 Atlantic Cable, "the picking-up tackle having given out, her Captain gives orders for her return to England.

At the foot of the picture is a lithographed extract from the letter of Captain (afterwards Sir James) Anderson to the owners of the ship, and a *fac simile* signature.

The subject measures 24in. by 17in., and is India mounted on fine etching boards, the mount measuring 27in. by 21in. The entire plate measures 36in. by 27in.

Price **10s. 6d.**, *in Special Frame,* **£1. 1s.**

A Handsome Reproduction of Herkomer's Famous Painting of

SIR JOHN PENDER, G.C.M.G., M.P.

Mounted India on fine etching boards. The subject measures 15in. by 11in., the mount 18½in. by 14½in., and the whole plate 28½in. by 21½in.

OTHER REPRODUCTIONS WILL FOLLOW SHORTLY.

Pocket size, price 2s. 6d., post free 2s. 8d.

MAY'S POPULAR INSTRUCTOR

FOR THE MANAGEMENT OF ELECTRIC LIGHTING PLANT.

An indispensable handbook for persons in charge of Electric Lighting plants, more particularly those who have had little or no technical training.

For office use, printed on cardboard, with metal edges and suspender, price 2s. each, post free 2s. 2d.
For the pocket, mounted on linen, in strong case, 2s. 6d. each, post free 2s. 8d.

MAY'S TABLE OF ELECTRIC CONDUCTORS.

Showing the relations between—(1) The sectional area, diameter of conductors, loss of potential, strength of current, and length of conductors; (2) The economies of incandescent lamps, their candle-power, potential, and strength of current; (3) The sectional area, diameter of conductors, and strength of current per square inch.

MAY'S BELTING TABLE.

Showing the relations between—(1) The number of revolutions and diameter of pulleys and velocity of belts; (2) The horse-power, velocity, and square section of belts; (3) The thickness and width of belts; (4) The square section of belts at different strains per square inch.

NINTH Edition. Revised and enlarged. Pocket size, leather, 8s. 6d., post free.

A POCKET-BOOK OF ELECTRICAL RULES & TABLES,

For the use of Electricians and Engineers.

By JOHN MUNRO, C.E., and ANDREW JAMIESON, C.E., F.R.S.E.

1, 2. and 3, Salisbury Court, Fleet Street, London, E.C.

Digitized by Google

Price 6s. 9d., post free.

COMPREHENSIVE INTERNATIONAL WIRE TABLE.

By W. S. BOULT.

Full particulars of 469 Conductors (4 gauges), Single Wires and Cables, in English, American, & Continental Units.

FOR THE POCKET. Price 2s. 6d.; post free, 2s. 7d.

THE WIRING SLIDE RULE

(TROTTER'S PATENT),

By which can be found at once:—1. Size of Cable; 2. Length of Cable; 3. Current Cable will carry; 4. Current Density; 5. Maximum Current; 6. Resistance in Ohms; 7. Sectional Area in Square Inches.

FULL PRINTED INSTRUCTIONS ARE SUPPLIED WITH EACH RULE.

THE

WOODHOUSE & RAWSON WIRING TABLES.

PRICE—Paper, 1/-, post free; Mounted and glazed 1/6, post free; in neat cloth case for pocket, 2/6, post free. mounted and glazed and bound in cloth for pocket, 2/6, post free.

Printed Directions how to use the Tables are issued with each Copy.

ELECTRICITY AND MAGNETISM

(ELEMENTARY AND ADVANCED).

MODERN VIEWS OF ELECTRICITY. By Oliver J. Lodge, F.R.S., Professor of Physics in University College, Liverpool. Illustrated. Crown 8vo, 6s. 6d.

THE ELECTRO-MAGNET AND ELECTROMAGNETIC MECHANISM. By Silvanus P. Thompson, D.Sc., F.R.S. 450 pages, 213 illustrations. 15s.

RECENT RESEARCHES IN ELECTRICITY AND MAGNETISM. By Prof. J. J. Thomson, M.A F.R.S. 18s. 6d.

ELECTRICAL PAPERS. For Advanced Students in Electricity. By Oliver Heaviside. 2 vols. 31s. 6d.

ELECTRIC WAVES: Being Researches on the Propagation of Electric Action with Finite Velocity through Space. By Dr. Heinrich Hertz. Translated by D. E. Jones. *Nearly ready.*

ELEMENTARY LESSONS IN ELECTRICITY AND MAGNETISM. By Silvanus P. Thompson, Principal and Professor of Physics in the Technical College, Finsbury. With illustrations. New Edition, revised. Eighth Edition. Fcap. 8vo, 4s. 6d.

PRACTICAL ELECTRICITY. For First Year Students of Electrical Engineering. By W. E. Ayrton, F.R.S., Professor of Electrical Engineering in the City and Guilds of London Central Institution. Fourth Edition. Illustrated throughout, 7s. 6d.

ELECTRICITY IN THE SERVICE OF MAN. A Popular and Practical Treatise on the Applications of Electricity in Modern Life. Translated and Edited, with Copious Additions, from the German of Dr. Alfred Ritter von Urbanitzky. By R. Wormell, D.Sc., M.A. With an Introduction by Prof. John Perry, F.R.S. Medium 8vo., with nearly 850 illustrations, price 9s.

ELECTRICITY IN MINING. By Silvanus P. Thompson, D.Sc., F.R.S. 2s.

ARITHMETIC OF ELECTRICITY. By Dr. T. O'Conor Sloane. 4s. 6d.

THE ARITHMETIC OF ELECTRICAL MEASUREMENTS. By W. R. P. Hobbs, Head Master of the Torpedo School, H.M.S. Vernon. New Edition. Price 1s.

A COURSE OF LECTURES ON ELECTRICITY, DELIVERED BEFORE THE SOCIETY OF ARTS. By George Forbes, M.A., F.R.S. (L. & E.) With 17 illustrations, crown 8vo, 5s.

SHORT LECTURES TO ELECTRICAL ARTIZANS. By Dr. J. A. Fleming, M.A., F.R.S., &c. Third Edition. 4s.

ELECTRICITY IN MODERN LIFE. By G. W. de Tunzelmann. With 88 illustrations, cloth, 3s. 6d.

DOMESTIC ELECTRICITY FOR AMATEURS. Translated from the French of E. Hospitalier, editor of *L'Electricien* with additions By C J. Wharton, Assoc. Soc. Tel. Engineers. Numerous illustrations, demy 8vo, cloth, 6s.

EXERCISES IN ELECTRICAL AND MAGNETIC MEASUREMENT, WITH ANSWERS. By R. E. Day, M.A. 12mo, 3s. 6d.

ELECTRICITY: ITS THEORY, SOURCES AND APPLICATIONS. By John T. Sprague. Third Edition. Revised and enlarged. 15s.

A TREATISE ON ELECTRICITY AND MAGNETISM. By J. Clerk Maxwell, M.A., F.R.S. Third Edition. 2 vols., demy 8vo, cloth, £1. 12s.

AN ELEMENTARY TREATISE ON ELECTRICITY. By J. Clerk Maxwell, M.A., F.R.S. Edited by William Garnett, M.A. Demy 8vo, cloth, 7s. 6d.

ALTERNATING CURRENTS OF ELECTRICITY. By T. H. Blakesley. Third Edition. 5s.

ALTERNATING CURRENTS OF ELECTRICITY. By Gisbert Kapp.

POLYPHASED ALTERNATING CURRENTS. By E. Hospitalier. 3s. 6d.

ELECTRICAL MEASUREMENT AND THE GALVANOMETER, ITS CONSTRUCTION AND USES. By T. D. Lockwood. Crown 8vo, cloth, 6s.

ELECTRICITY AND MAGNETISM. By Prof. Balfour Stewart, F.R.S., and W. W. Haldane Gee, Demonstrator and Assistant Lecturer in Owens College, Manchester. Crown 8vo, 7s. 6d.; School Course, 2s. 6d.

THEORY AND PRACTICE OF ABSOLUTE MEASUREMENTS IN ELECTRICITY AND MAGNETISM. By Andrew Gray, M.A., F.R.S.E., Professor of Physics in the University College of North Wales. In 2 vols., crown 8vo. Vol. I., 12s. 6d. Vol. II., in 2 parts, 25s.

AN INTRODUCTION TO THE THEORY OF ELECTRICITY. By Linnæus Cumming, M.A. New Edition, with illustrations, crown 8vo, 8s. 6d.

Digitized by Google

ELECTRICAL INFLUENCE MACHINES: containing a full account of their Historical Development, their Modern Forms, and their Practical Construction. By John Gray, B.Sc 89 illustrations. 4s. 6d.

MAGNETISM AND ELECTRICITY, AN ELEMENTARY MANUAL OF. With Examination Questions and 245 illustrations. By Prof. Jamieson. Second Edition. Crown 8vo, 3s. 6d

KIRCHOFF'S LAWS AND THEIR APPLICATION. By E. C. Rimington. Cloth, 1s. 6d.

MAGNETISM AND ELECTRICITY. By A. W. Poyser, M.A. Cloth, 4s. 6d.

PRACTICAL ELECTRICS: A Universal Handy Book on Every-Day Electric Matters. Third Edition 3s. 6d.

THE A B C OF ELECTRICITY. By W. A. Meadowcroft. Illustrated. Cloth, 2s.

PRACTICAL ELECTRICAL MEASUREMENT. By James Swinburne. Cloth, 4s. 6d.

EXERCISES IN ELECTRICAL AND MAGNETIC MEASUREMENTS, with Answers. By R. E. Day. 3s. 6d.

FIRST BOOK OF ELECTRICITY AND MAGNETISM. By W. Perren Maycock. 80 illustrations. 2s. 6d.

MANUAL OF ELECTRICAL SCIENCE. By George J. Burch, B.A. 3s.

EVERYBODY'S HANDBOOK OF ELECTRICITY. By Edward Trevert. 1s.

MAGNETISM AND ELECTRICITY. For the use of students in schools and science classes. By H. C. Tarn. F.S.Sc. With numerous diagrams. Cloth, 2s.

ELEMENTS OF STATIC ELECTRICITY. By P. Atkinson, Ph.D. 7s. 6d.

A TREATISE ON MAGNETISM. By Sir G. B. Airy, K.C.B. 9s. 6d.

A TREATISE ON ELECTRICITY AND MAGNETISM. By G. W. de Tunzelmann, B.Sc., M.I.E.E. *In preparation*

MAGNETISM AND ELECTRICITY. By R. Wallace Stewart. 160 Illustrations. 5s. 6d.

MAGNETISM AND ELECTRICITY. By Edward Aveling, D.Sc. With numerous woodcuts. 6s.

ELECTRICITY TREATED EXPERIMENTALLY, for the use of schools and students. By Linnæus Cumming, M.A. 4s. 6d.

ELECTRICITY AND MAGNETISM. By S. Bottone.

POTENTIAL: Its Application to the Explanation of Electrical Phenomena Popularly Treated. By Dr. Tumlirz. Translated by D. Robertson, M.A. 3s. 6d.

BOOK E. ARITHMETICAL PHYSICS. Part II.A—MAGNETISM AND ELECTRICITY, ELEMENTARY AND ADVANCED. With Supplement on Lines of Force. By C. J. Woodward, B.Sc. 2s.

BOOK F. ARITHMETICAL PHYSICS. Part II.B—MAGNETISM AND ELECTRICITY, DEGREE AND HONOURS STAGES. By C. J. Woodward, B.Sc. New Edition. 3s. 6d.

A PRACTICAL TREATISE ON THE MEDICAL AND SURGICAL USES OF ELECTRICITY. By Drs. Beard and Rockwell. 200 illustrations Royal 8vo. 28s.

PRACTICAL APPLICATION OF ELECTRICITY IN MEDICINE AND SURGERY. By Drs. Liebig and Rohé. Royal 8vo, 400 pages, profusely illustrated, 8s. 6d.

ELECTRICITY IN THE DISEASES OF WOMEN. By G. Betton Massey, M.D. Second Edition. 12mo, 6s. 6d.

A TEXT-BOOK OF ELECTRICITY IN MEDICINE AND SURGERY. By George Vivian Poore, M.D. Crown 8vo, 8s. 6d.

A MANUAL OF PRACTICAL ELECTRO-THERAPEUTICS. By Arthur Harries, M.D., and H. Newman Lawrence, M.I.E.E. With illustrations, 1s. 6d.

A HANDBOOK FOR OPERATORS IN MEDICAL ELECTRICITY AND Massage. By H. Newman Lawrence, M.I.E.E. 1s.

A MANUAL OF ELECTRO-THERAPEUTICS. By W. Erb, M.D., translated by A. de Watteville, M.D., &c. Demy 8vo, 18s.

ELECTRICITY AND ITS MANNER OF WORKING IN THE TREATMENT OF DISEASE. A Thesis for the M.D. Cantab Degree, 1884. By the late William E. Steavenson, M.D., M.R.C.P., Casualty Physician and Electrician to St. Bartholomew's Hospital. To which is appended an Inaugural Medical Dissertation on Electricity for the M.D., Edin. Degree, written in Latin by Robert Steavenson, M.D. in 1778, with a Translation by the Rev. F. R. Steavenson, M.A. 8vo, 4s. 6d.

TRAITÉ ÉLÉMENTAIRE D'ÉLECTRICITÉ. By J. Joubert. With 321 illustrations. 6s

SUR LA PROPAGATION DU COURANT ÉLECTRIQUE. By A. Bandsept. 1s.

ÉLECTRICITÉ INDUSTRIELLE. By D. Monnier. With 338 illustrations. 16s.

LEÇONS SUR L'ELECTRICITÉ. By Eric Gerard. 2 vols., fully illustrated. 16s.

FORMULAIRE DE L'ELECTRICITÉ. By E. Hospitalier. 10th year: 1892. 4s. 6d.

TRAITÉ PRATIQUE DE L'ELECTRICITÉ. By Felix Lucas. 13s. 6d.

ELECTRIC LIGHTING AND TRANSMISSION OF POWER.

PRINCIPLES OF DYNAMO-ELECTRIC MACHINES. By Carl Hering. Practical Directions for Designing and Constructing Dynamos. With an Appendix containing several Articles on Allied Subjects, and a Table of Equivalents of Units of Measurement. Cloth, 279 pages, 59 illustrations, 10s. 6d.

DYNAMO-ELECTRICITY: Its Generation, Application, Transmission, Storage and Measurement. By G. B. Prescott. 545 illustrations. £1 1s.

THEORETICAL ELEMENTS OF ELECTRO-DYNAMIC MACHINERY Vol. I. By A. Kennelly, F.R.A.S. 4s. 6d.

RULES AND REGULATIONS RECOMMENDED FOR THE PREVENTION OF FIRE RISKS FROM ELECTRIC LIGHTING, issued by the Society of Telegraph-Engineers. 8vo. sewed, 6d.

THE PHŒNIX FIRE OFFICE RULES FOR ELECTRIC LIGHT INSTALLATIONS AND ELECTRICAL POWER INSTALLATIONS. By Musgrave Heaphy, C.E. Eighteenth Edition, 8vo, sewed, 6d.

THE DISTRIBUTION OF ELECTRICITY. By Prof. George Forbes, M.A., F.R.S.E. 1s.

SECONDARY BATTERIES AND THE ELECTRICAL STORAGE OF ENERGY. By Dr. Oliver Lodge. 1s.

THE CHEMISTRY OF THE SECONDARY BATTERIES OF PLANTÉ AND FAURE. By J. H. Gladstone and A. Tribe. 2s. 6d.

ELEMENTARY PRINCIPLES OF ELECTRIC LIGHTING. By Alan A. Campbell Swinton. Enlarged and revised. Crown 8vo. cloth, 1s. 6d.

THE STORAGE OF ELECTRICAL ENERGY, AND RESEARCHES IN THE EFFECTS CREATED BY CURRENTS COMBINING QUANTITY WITH HIGH TENSION By G Planté. Translated from the French by Paul Bedford Elwell. With 89 illustrations, 8vo, cloth, 12s.

THE GALVANOMETER AND ITS USES. A Manual for Electricians and Students. By C. H. Haskins. Second edition. Illustrated. 18mo., 8s. 6d.

ELECTRIC LIGHT CABLES AND THE DISTRIBUTION OF ELECTRICITY. By Stuart A. Russell, Assoc.M.Inst.C.E. 107 illustrations. 7s. 6d.

DYNAMO MACHINERY (ORIGINAL PAPERS ON). By Dr. John Hopkinson. 5s.

CONTINUOUS-CURRENT DYNAMOS AND MOTORS. By Frank P. Cox. 9s.

HOW TO MAKE A DYNAMO. By Alfred Crofts. Third Edition. 2s.

THE DYNAMO: HOW MADE AND HOW USED. By S. R. Bottone. With 89 illustrations Eighth Edition. 2s. 6d.

THE DYNAMO. By C. C. Hawkins, A.M.Inst.C.E., and F. Wallis. *In preparation.*

HOW TO MANAGE A DYNAMO. By S. R. Bottone. 1s.

PRACTICAL MANAGEMENT OF DYNAMOS. By F. B. Crocker. 4s. 6d.

PRACTICAL TREATISE ON ELECTRIC LIGHTING. By J. E. H. Gordon. Illustrated. 8vo, 18s.

ARC AND GLOW LAMPS: A PRACTICAL HANDBOOK ON ELECTRIC LIGHTING. By Julius Maier, Ph.D., &c. *A new edition in preparation.*

ELECTRIC LIGHT ARITHMETIC. By R. E. Day. 2s.

PRACTICAL ELECTRIC LIGHTING. By A. Bromley Holmes. Fourth Edition, cloth, 3s. 6d.

THE ELECTRIC LIGHT POPULARLY EXPLAINED. By A. Bromley Holmes. Fifth Edition, 1s.

ELECTRO-MAGNETISM AND THE CONSTRUCTION OF CONTINUOUS-CURRENT DYNAMOS. Vol. I. By Prof. Dugald C. Jackson. 9s. 6d.

Digitized by Google

PRIMERS OF ELECTRICITY. By Prof. Houston. Paper boards. Price 1s. 6d., post free.

ELECTRIC LIGHTING AND POWER DISTRIBUTION: An Elementary Manual for Students. By W. Perren Maycock. Parts I. and II., 2s. 6d. each.

PRACTICAL ELECTRIC LIGHT FITTING. By F. C. Allsop. 5s.

ELECTRIC LIGHTING FOR MARINE ENGINEERS. By S. F. Walker. 5s.

COLLIERY LIGHTING BY ELECTRICITY. By S. F. Walker. 2s. 6d.

ELECTRICITY IN OUR HOMES AND WORKSHOPS. By S. F. Walker. Second Edition. Cloth, 5s.

HOUSE LIGHTING BY ELECTRICITY, Popularly Explained. By Angelo Fahie. Paper, 1s.; cloth, 2s.

DOMESTIC ELECTRIC LIGHTING. By E. C. de Segundo. 1s.

A GUIDE TO ELECTRIC LIGHTING. By S. Bottone. Second Edition. 1s.

A PRACTICAL TREATISE ON THE INCANDESCENT LAMP. By J. H. Randell. 2s. 6d.

CONTINENTAL ELECTRIC LIGHT CENTRAL STATIONS. By Killingworth Hedges. 15s.

ELECTRIC LIGHTING FROM CENTRAL STATIONS. By Prof. George Forbes. 1s.

ARTIFICIAL LIGHTING IN RELATION TO HEALTH. By R. E. B. Crompton. 6d.

ELECTRIC LIGHTING SPECIFICATIONS. By E. A. Merrill. 6s.

ELECTROMOTORS: How Made and How Used. By S. R. Bottone. Second Edition. 3s.

ELECTRIC MOTOR CONSTRUCTION FOR AMATEURS. By Lieut. C. D. Parkhurst, R.A. 4s.

TRANSFORMERS: Their Theory, Construction, and Application, Simplified. By Caryl D. Haskyns. 4s. 6d.

ELECTRIC TRANSMISSION OF ENERGY, and its Transformation, Subdivision and Distribution. By Gisbert Kapp. Third Edition. 7s. 6d.

ELECTRIC TRANSMISSION OF POWER. By Philip Atkinson. 7s. 6d.

ELECTRIC RAILWAYS, RECENT PROGRESS IN. By Carl Hering. 5s.

THE ELECTRIC RAILWAY. By Fred. H. Whipple. With illustrations, 4s. 6d.

PRACTICAL ELECTRICAL NOTES AND DEFINITIONS, for the use of Engineering Students and Practical Men. By W. Perren Maycock. Second Edition. 3s.

LES ACCUMULATEURS ÉLECTRIQUES. By A. Bandsept. 103 pages. 2s.

INDUCTEURS DYNAMO-ÉLECTRIQUES ET PYRO-ÉLECTRIQUES. By A. Bandsept. 6d.

TRAITÉ DES PILES ÉLECTRIQUES; Piles hydro-électriques—Accumulateurs—Piles thermo-électriques et pyro-électriques. By Donato Tommasi, Docteur-es-Sciences. 8vo., 670 pages, with 160 illustrations. 10s.

TRAITÉ ÉLÉMENTAIRE DE LA PILE ÉLECTRIQUE. By Alfred Niaudet. Third Edition. Revised by Hippolyte Fontaine, and followed by a Notice on Accumulators by E. Hospitalier. Illustrated, 8vo, 6s. 6d.

ÉCLAIRAGE À L'ÉLECTRICITÉ. By Hippolyte Fontaine. Third Edition, entirely re-written, with 326 illustrations, 8vo, 13s.

DIE DYNAMOELEKTRISCHE MASCHINE: EINE PHYSIKALISCHE BESCHREIBUNG FUR DEN TECHNISCHEN GEBRAUCH. By Dr. O. Frolich. With illustrations Large 8vo, 8s.

DIE ELEKTRISCHE BELEUCHTUNG. By Prof. Dr. E. Hagen. With illustrations. large 8vo, 8s.; cloth, 9s.

DIE ACCUMULATOREN FÜR ELEKTRICITÄT. By Edmund Hoppe. With illustrations. 6s.

UNTERSUCHUNGEN UEBER DIE AUSBREITUNG DER ELEKTRISCHEN KRAFT. By Prof. Dr. H. Hertz. Price 6s.

TELEGRAPHY AND TELEPHONY.

TELEGRAPHY. By W. H. Preece, F.R.S., M.I.C.E., and J. Sivewright, M.A., C.M.G. Ninth Edition, revised and enlarged. With 250 woodcuts and diagrams, fcap. 8vo, 6s.

HANDBOOK OF PRACTICAL TELEGRAPHY. By R. S. Culley, M.Inst.C.E. Eighth Edition. 17 plates and 135 woodcuts, 8vo, 16s.

ELECTRICAL TABLES AND FORMULÆ FOR THE USE OF TELEGRAPH INSPECTORS AND OPERATORS. Compiled by Latimer Clark and Robert Sabine. With wood engravings, crown 8vo, cloth, 12s. 6d.

THE ELECTRIC TELEGRAPH: ITS HISTORY AND PROGRESS. With Descriptions of some of the Apparatus. By R. Sabine, C.E., F.S.A. Limp cloth, 3s.

PRACTICAL GUIDE TO THE TESTING OF INSULATED WIRES AND CABLES. By Herbert Laws Webb. 4s. 6d.

COMMERCIAL AND RAILWAY TELEGRAPHY, MODERN SERVICE OF. Designed for Students and Operators. Compiled and prepared by J. P. Abernethy. Seventh edition, carefully revised, 427 pages, many illustrations, 8s. 6d. Invaluable for students and operators seeking appointments in the United States.

INSTRUCTIONS FOR TESTING TELEGRAPH LINES, and the Technical Arrangements in Offices. By Louis Schwendler. Demy 8vo, 21s.

TABLES TO FIND THE WORKING SPEED OF CABLES, comprising also Data as to Diameter, Capacity, and Copper Resistance of all Cores. By A. Dearlove. 2s.

ON A SURF-BOUND COAST: CABLE-LAYING IN THE AFRICAN TROPICS. By Arthur P. Crouch, B.A. 7s. 6d.; New Edition, 5s.

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH. By Frank L. Pope Fourteenth Edition, with numerous wood engravings, 8vo, cloth, 12s. 6d.

ELECTRICITY AND THE ELECTRIC TELEGRAPH. With numerous illustrations. By George B. Prescott. Sixth Edition, 2 vols., 8vo, cloth, £1. 1s.

THE ELECTRIC TELEGRAPH. By Dr. Lardner. Revised and re-written by E. B. Bright, F.R.A.S. With 140 illustrations, small 8vo, cloth, 2s. 6d.

ELECTRICITY, MAGNETISM, AND ELECTRIC TELEGRAPHY: A Practical Guide and Handbook of General Information for Electrical Students, Operators and Inspectors. By Thomas D. Lockwood. Second Edition. 12s. 6d.

TELEGRAPHIC CONNECTIONS: Embracing Recent Methods in Quadruplex Telegraphy. By Charles Thom and W. H. Jones. 7s. 6d.

RECENT ADVANCES IN TELEGRAPHY. By W. H. Preece. 2s.

MANUAL OF TELEPHONY. By W. H. Preece and A. J. Stubbs. Over 500 pages and 334 illustrations. 15s.

THE TELEPHONE. By W. H. Preece, F.R.S., and J. Maier, Ph.D. With 290 illustrations, crown 8vo, 12s. 6d.

TELEPHONES: THEIR CONSTRUCTION AND FITTING. By F. C. Allsop. 168 illustrations. 5s.

TELEPHONE LINES AND THEIR PROPERTIES. By Prof. W. J. Hopkins. 6s.

THE PRACTICAL TELEPHONE HANDBOOK AND GUIDE TO TELEPHONIC EXCHANGE. By Joseph Poole. 3s. 6d.

THE TELEPHONING OF GREAT CITIES, AND AN ELECTRICAL PARCEL EXCHANGE SYSTEM. By A. R. Bennett. 1s.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch By Silvanus P. Thompson, B.A., D.Sc. With portrait and wood engravings. 8vo, cloth, 7s. 6d.

TRAITÉ DE TÉLÉGRAPHIE SOUS-MARINE. By E. Wünsdhendorff, Ingénieur des Télégraphes, Directeur de Télégraphie Militaire. With 469 illustrations, 8vo, 33s.

ELECTRO-CHEMISTRY AND ELECTRO-METALLURGY.

ELECTRO-METALLURGY: PRACTICALLY TREATED. By Alexander Watt, F.R.S.S.A. Ninth Edition. 12mo, cloth boards, 4s.

THE ART OF ELECTRO-METALLURGY, INCLUDING ALL KNOWN PROCESSES OF ELECTRO-DEPOSITION. By G. Gore, LL.D., F.R.S. With 56 illustrations, fcp. 8vo, 6s.

Digitized by Google

ELECTRO-DEPOSITION: A PRACTICAL TREATISE ON THE ELECTROLYSIS OF GOLD, SILVER, COPPER, NICKEL, AND OTHER METALS AND ALLOYS. By Alexander Watt, F.R.S.S.A. With numerous illustrations. Third Edition. Crown 8vo, cloth, 9s.

A TREATISE ON ELECTRO-METALLURGY. By Walter G. McMillan. 10s. 6d.

THE USES OF ELECTROLYSIS IN SURGERY. By W. E. Steavenson, M.D., M.R.C.P. Cloth, 5s.

ELECTRO-PLATER'S HANDBOOK. By G. E. Bonney. 61 Illustrations. 3s.

ELECTRO-DEPOSITION OF METALS. By G. Langbein. 25s.

TRAITÉ THÉORIQUE ET PRATIQUE D'ÉLECTROCHIMIE. By Donato Tommasi, Docteur-ès-Sciences. Large 8vo, 1,200 pages. 36s.

MISCELLANEOUS.

PRACTICAL ELECTRIC BELL FITTING. By F. C. Allsop. 3s. 6d.

ELECTRIC BELL CONSTRUCTION. By F. C. Allsop. 3s. 6d.

ELECTRIC BELLS, AND ALL ABOUT THEM. By S. R. Bottone. Fourth Edition. With numerous illustrations, crown 8vo, 3s.

ELECTRICAL INSTRUMENT MAKING FOR AMATEURS. A Practical Handbook. By S. R. Bottone, Author of "The Dynamo," &c. 71 illustrations, Fifth Edition, cloth, 3s.

INDUCTION COILS: A Practical Manual for Amateur Coil Makers. By G. E. Bonney. More than 200 pages, 150 illustrations. 3s.

ELECTRIC TOY MAKING, DYNAMO BUILDING AND ELECTRIC MOTOR CONSTRUCTION FOR AMATEURS. By T. O'Conor Sloane, Ph.D. 4s. 6d.

STANDARD TABLES FOR ELECTRIC WIREMEN. By Charles M. Davis. 4s. 6d.

ELECTRICAL EXPERIMENTS. By G. E. Bonney. 2s. 6d.

THE PHONOGRAPH: and How to Construct It. By W. Gillett. 5s.

SCIENTIFIC AND TECHNICAL PAPERS of WERNER VON SIEMENS. Translated from the German. Vol. I., Scientific Papers and Addresses. 14s. *Vol. II. in preparation.*

PERSONAL RECOLLECTIONS OF WERNER VON SIEMENS. Translated by W. C. Coupland. 15s.

LAW RELATING TO ELECTRIC LIGHTING. By G. S. Bower and W. Webb. Entirely re-written. 8vo, 12s. 6d.

ELECTRICAL TABLES AND MEMORANDA. By Silvanus P. Thompson, D.Sc., and Eustace Thomas. Waistcoat-pocket size, 1s.; post free. 1s. 1d.

A POCKET-BOOK OF USEFUL FORMULÆ AND MEMORANDA FOR CIVIL AND MECHANICAL ENGINEERS. By Sir G. L. Molesworth, K.C.B. Twenty-second Edition, 6s.; interleaved with ruled paper, 9s.

THE MECHANICAL ENGINEER'S POCKET-BOOK. By D. K. Clark. Cloth, 7s. 6d.; leather, 9s.

SMITH'S TABLES AND MEMORANDA, for Mechanics, Engineers, Builders, Contractors, &c. By Francis Smith. Fifth Edition, revised and enlarged. Waistcoat pocket size, 1s. 6d.

ELECTRICAL ENGINEERING AS A PROFESSION, AND HOW TO ENTER IT. By A. J. Southam. 4s. 6d.

AID BOOK TO ENGINEERING ENTERPRISE ABROAD. By Ewing Matheson, M.I.C.E. New edition. 850 pages. £1 1s.

WIRE: ITS MANUFACTURE AND USES. By J. Bucknall Smith. 7s. 6d.

MODERN MECHANISM, exhibiting the latest Progress in Machines, Motors and the Transmission of Power. Edited by Park Benjamin, LL.B., Ph.D. 30s.

ELEMENTARY MECHANICS. By Oliver J. Lodge, D.Sc. Lond. Revised Edition, 208 pages. Cloth, 3s.

LIVES OF THE ELECTRICIANS. First Series: Profs. TYNDALL, WHEATSTONE AND MORSE. By William T. Jeans. Crown 8vo, cloth, 6s.

THE JOURNAL OF THE INSTITUTION OF ELECTRICAL ENGINEERS (formerly the Society of Telegraph-Engineers and Electricians). Issued at irregular intervals.

LIGHTNING CONDUCTORS AND LIGHTNING GUARDS. By Prof. Oliver J Lodge, D.Sc., &c. With numerous illustrations. 15s.

Digitized by Google

LIGHTNING CONDUCTORS: THEIR HISTORY, NATURE, AND MODE OF APPLICATION. By Richard Anderson, F.C.S., F.G.S. Cloth, 8vo, 12s. 6d.

POPULAR LECTURES AND ADDRESSES ON VARIOUS SUBJECTS IN PHYSICAL SCIENCE. By Sir William Thomson (Lord Kelvin). In three vols., 7s. 6d. each.

PRACTICAL PHYSICS. By R. T. Glazebrook and W. N. Shaw. 6s.

MANUAL OF PHYSICS. By William Peddie, F.R.S.E. 7s. 6d.

EXAMPLES IN PHYSICS. By D. E. Jones, B.Sc., Professor of Physics in the University College of Wales, Aberystwith. Fcap. 8vo, 3s. 6d.

ROMANCE OF ELECTRICITY. By John Munro. Crown 8vo, 5s.

EXPERIMENTAL SCIENCE. By G. M. Hopkins. 680 engravings. Cloth, 18s.

A B C FIVE-FIGURE LOGARITHMS; OR, LOGARITHMS WITH DIFFERENCES ON A NEW AND SIMPLE PLAN. By C. J. Woodward, B.Sc. Cloth, 2s. 6d.

DICTIONARY OF METRIC AND OTHER USEFUL MEASURES. By Latimer Clark, F.R.S., &c. Crown 8vo, 6s.

THE MECHANICS OF MACHINERY. By Prof. A. B. W. Kennedy. 12s. 6d

MACHINE DRAWING AND DESIGN. By Prof. William Ripper. In one Vol., 25s.; or in five parts, 4s. 6d. each.

AN INTRODUCTION TO MACHINE DRAWING AND DESIGN. By David Allan Low (Whitworth Scholar). With 65 illustrations and diagrams, crown 8vo, 2s.

MANUAL OF MACHINE DRAWING AND DESIGN. By David Allan Low and Alfred Wm. Bevis. 7s. 6d.

FIRST COURSE IN MACHINE DRAWING (Tracing). PART II., ELECTRICAL ENGINEERING. By G. Halliday. 2s. 6d.

THE MECHANIC'S WORKSHOP HANDYBOOK: A Practical Manual on Mechanical Manipulation. By Paul N. Hasluck, A.I.M.E. Crown 8vo, cloth 2s.

HYDRAULIC MOTORS: Turbines and Pressure Engines. By G. R. Bodmer, Assoc.M.Inst.C.E. With 179 illustrations. 14s.

BARLOW'S TABLES OF SQUARES, CUBES, SQUARE ROOTS, CUBE ROOTS. Reciprocals of all Integer Numbers up to 10,000. Post 8vo, cloth, 6s.

DICTIONARY OF CHEMISTRY (Watts'). Revised and entirely rewritten by H. Forster Morley, M.A., D.Sc., and M. M. Pattison Muir, M.A., F.R.S.E., assisted by eminent contributors. 4 vols., 8vo, 42s. each.

A DICTIONARY OF APPLIED CHEMISTRY. By T. E. Thorpe, assisted by Eminent Contributors. Vols. I. and II., £2. 2s. each; Vol. III. £3. 3s.

A TREATISE ON CHEMICAL PHYSICS. By Professors T. E. Thorpe and and A. W. Rücker. *In preparation.*

PRACTICAL CHEMISTRY, INCLUDING ANALYSIS. By J. E. Bowman and Prof. C. L. Bloxam. Eighth Edition. With 90 engravings, fcap. 8vo, 5s. 6d.

CHEMISTRY. By T. Bolas, F.C.S., F.I.C. *In preparation.*

CHEMICAL THEORY FOR BEGINNERS. By L. Dobbin, Ph.D., and J. Walker, Ph.D., D.Sc. 2s. 6d.

METAL TURNING. By a Foreman Pattern-maker. With 81 illustrations. 4s.

ALUMINIUM: Its History, Occurrence, Properties, Metallurgy, and Applications, including its Alloys. By J. W. Richards. Second Edition. 511 pages, £1. 1s.

SPINNING TOPS. By Prof. J. Perry. 2s. 6d.

SOAP BUBBLES, and the Forces which Mould Them. By C. V. Boys. 2s. 6d.

THE GRAPHIC ATLAS AND GAZETTEER OF THE WORLD. 128 Map Plates and Gazetteer of 280 pages. Crown 4to, cloth, 12s. 6d; half-morocco, 15s.; full morocco, 21s.

HISTOIRE D'UN INVENTEUR: Exposé des Decouvertes et des Travaux de M. Gustave Trouvé. By Georges Barral. With portrait of M Trouvé and 280 illustrations.

MÉCANIQUE MOLÉCULAIRE. By A. Bandsept. 1s. 6d.

MANUEL D'ELECTROLOGIE MÉDICALE. By Gustave Trouvé. 7s.

PRODUCTION ET UTILISATION RATIONNELLES DE LA CHALEUR INTENSIVE. By A. Bandsept. 2s. 6d.

THE OLDEST AND BEST ELECTRICAL JOURNAL.

EVERY FRIDAY, PRICE 4d., POST FREE 4½d.

THE ELECTRICIAN:

An Illustrated Journal

OF

ELECTRICAL ENGINEERING, INDUSTRY, AND SCIENCE.

"THE ELECTRICIAN" has a much larger circulation than any other Electrical Journal, and contains

Special Original Articles and Papers by Leading Electricians and Electrical Engineers,

TOGETHER WITH

ILLUSTRATED DESCRIPTIONS OF NEW APPARATUS, PROCESSES, INSTALLATIONS, &c.

Terms of Subscription:

	Year.	Half-Year.	Quarter.
Great Britain	£0 19 6	£0 10 0	£0 5 0
Countries in the Postal Union	1 4 0	0 12 6	0 6 6
Outside the Postal Union	1 8 0	0 14 6	0 7 6

"THE ELECTRICIAN" is read by everybody interested in Electricity everywhere, and is, therefore,

THE VERY BEST MEDIUM FOR ADVERTISING.

For full particulars of Advertising Rates, &c., apply to the Publishing Offices,

1, 2, & 3, SALISBURY COURT, FLEET STREET, LONDON, E.C.

PUBLISHED IN JANUARY OF EACH YEAR. ROYAL 8vo.

Subscription price, **5s.**; postage extra. After date of Publication, **7s. 6d.**; postage extra.

"THE ELECTRICIAN"

ELECTRICAL TRADES' DIRECTORY

AND

HANDBOOK.

THE CHEAPEST, LARGEST AND ONLY RELIABLE DIRECTORY PUBLISHED FOR THE

ELECTRICAL AND KINDRED TRADES.

BEFORE ORDERING ANY SIMILAR PUBLICATION, obtain a Copy of the last Issue of the above, and **carefully compare.**

This Book is unlike any similar publication, inasmuch as the names and addresses are to be depended upon. Each entry is carefully revised before insertion. The Handbook Section is most useful to all persons engaged in Electrical Pursuits.

NEW NAMES, and CORRECTIONS to Existing Entries, are RECEIVED up to the END OF DECEMBER in each year. No charge is made for inserting names, addresses, and occupations. Blanks for new names will be sent by return post to any applicant.

Full particulars of ADVERTISING RATES, ENTRIES UNDER TRADE HEADINGS, &c., which are very low, sent immediately on application.

ALL LEADING ELECTRICAL AND ENGINEERING FIRMS SUBSCRIBE TO AND ADVERTISE IN THIS DIRECTORY, and no Electrician, Electrical Engineer, or other person engaged in Electrical or Kindred Trades should omit to order a Copy of it.

An eight-page Digest of the contents of the last issue and all particulars forwarded post free to any address.

"THE ELECTRICIAN" PRINTING & PUBLISHING COMPANY, Ltd.,

1, 2, and 3, SALISBURY COURT, FLEET STREET, LONDON, ENGLAND.

Telephone 2714. **Telegrams: "Electrician Newspaper London."**

EVERY FRIDAY, PRICE 4d., POST FREE 4½d.

THE ELECTRICIAN.

"THE ELECTRICIAN" was originally established in 1861, in a form similar to the present publication, and after occupying a leading position amongst scientific journals for a period of about three years, was discontinued, not, however, before it had become apparent that such a publication occupied an essential place amongst the scientific and technical journals.

From 1864 to 1878 was a period during which the absence of "THE ELECTRICIAN" was much felt, no weekly paper devoted to the interests of the electrical profession being then in existence; and, as has frequently been the case, it was left for gentlemen taking a keen interest in the applications of electricity to telegraphic purposes, which were at that time the principal electrical industries, to resuscitate "THE ELECTRICIAN," and once again establish it as the recognised leading organ of electrical science and industry. It will thus be seen that "THE ELECTRICIAN" is the oldest electrical journal published. Since its second advent, and especially since the end of the year 1887, "THE ELECTRICIAN" has made rapid progress, and has continued to record in a full and thorough manner all the great discoveries and experiments in electrical science, and to illustrate how these could be commercially applied and profitably worked. In the volumes of "THE ELECTRICIAN" will be found a most valuable collection of original papers and articles by nearly every leading electrical writer of note, including:—

Prof. W. G. Adams,
Mr. G. L. Addenbrooke,
Sir James Anderson,
Mr. L. B. Atkinson,
Prof. W. E. Ayrton,
Prof. W. F. Barrett,
Mr. Shelford Bidwell,
Mr. T. H. Blakesley,
Mr. C. Vernon Boys,
Major P. Cardew,
Mr. E. T. Carter,
Mr. R. E. Crompton,
Prof. W. Crookes,
Prof. J. Dewar,
Mr. W. B. Esson,
Mr. Sydney Evershed,
Prof. J. A. Ewing,
Mr. C. A. Faure,
Mr. Desmond G. FitzGerald
Dr. J. A. Fleming,
Prof. George Forbes,
Prof. W. Garnett,
Mr. W. Geipel,
Dr. Gladstone,
Prof. R. T. Glazebrook,
Dr. George Gore.
Mr. Oliver Heaviside,
Prof. von Helmholtz,
Dr. H. Hertz,
Mr. Paget Higgs,
Dr. Edward Hopkinson,
Dr. John Hopkinson,
Prof. E. J. Houston,
Prof. D. E. Hughes,
Mr. Gilbert Kapp,
Prof. A. B. W. Kennedy,
Mr. A. E. Kennelly,
Dr. Oliver Lodge,
Prof. J. Clerk Maxwell,
Prof. Mengarini,
Mr. W. M. Mordey,

And all papers read before the principal Electrical Institutions throughout the world by men eminent in the Electrical Profession have been given, together with authenticated reports of the discussions thereupon.

In addition to the above, "THE ELECTRICIAN" forms a complete record of all the important legal investigations which have occupied the attention of the Courts of Justice for the past 14 years, and it is customary for "THE ELECTRICIAN" to occupy a prominent position in the Courts as an authority upon all questions affecting the Electrical Profession. In this connection it is only necessary to point to the actions which have arisen from time to time upon the Edison and Swan Patents, the Compound Winding Patents, the High and Low Tension Systems, the Accumulator Patents, the Telephone Patents, etc., etc., in which "THE ELECTRICIAN" has figured as a reliable authority, and has been put in evidence and accepted by the parties concerned.

A regular feature in "THE ELECTRICIAN" has always been the verbatim reports of meetings of Electrical Companies and Corporations, and while "THE ELECTRICIAN" has never trenched upon the grounds legitimately occupied by the financial journals, the information of a financial character given from week to week in its columns is full, reliable, and absolutely unbiassed. It has no interest whatever in any financial schemes, and is devoted entirely to the interests of the profession it was established to serve. "THE ELECTRICIAN" gives full reports of Meetings, &c., held on Thursdays, so that subscribers interested obtain their copies by Friday morning's post.

The original articles appearing in "THE ELECTRICIAN" are written by gentlemen having no interest whatever in particular electrical systems, and with but one object, and that the advancement of electrical knowledge and electro-technology generally. Many of these original series of articles have since been revised by their authors, and published in book form. These form the nucleus of the well-known "**Electrician**" **Series**, of which further particulars will be found herewith.

(For Subscription Rates, Publishing Offices, &c., see opposite page.)

JAMES J. HICKS,

8, 9, and 10, HATTON GARDEN, LONDON, E.C.

MAKER OF

All kinds of Thermometers and Hydrometers for Electrical Purposes, Patentee of Hicks's famous Coloured Bead Battery Hydrometer, also manufacturer of Every Description of Electrical Apparatus, viz.:—Galvanometers, Chronographs, Range Finders, Wheatstone's Bridge, Lamps, Galvanometer Mirrors, &c., &c.

ANY ELECTRICAL INSTRUMENT MADE TO ORDER.

Primers of Electricity

BY

PROF. HOUSTON, W. H. SNELL, &c.,

And will be sold at 33 per cent. off published price, *i.e.*, paper boards, 1/0; post-free, 1/2.

This Book contains 32 Primers dealing with the following subjects:—

Arc Lights.
Incandescent Lights.
Dynamo Electric Machines.
Voltaic Batteries.
Electric Circuits.
Effects of an Electric Current.
Magnetism.
Electro-Magnetism.
Electricity produced by Friction.
The Telephone.
The Microphone.
The Storage Battery.
The Electric Telegraph.
Electro-Metallurgy.
Electric Motors.
The Transmission of Energy.
The Lightning Rod.
Electric Measurements of Minute Times.
The Galvanometer.
Electric Clocks.
Synchronous Multiplex Telegraphy.
Electric Arc Lamps.
The Ruhmkorff Induction Coil.
The Jablochkoff Candle.
Sources of Electricity.
Galvanometer Constants.
The Arrangement of Batteries.
Submarine Telegraph Cables: The Insulation Test.
Ohm's Law.
Submarine Telegraph Cables: The Copper Resistance Test.
Alternating Currents.
The Secondary Generator or Transformer.

THE

GARDNER DYNAMOS & MOTORS.

— FOR —

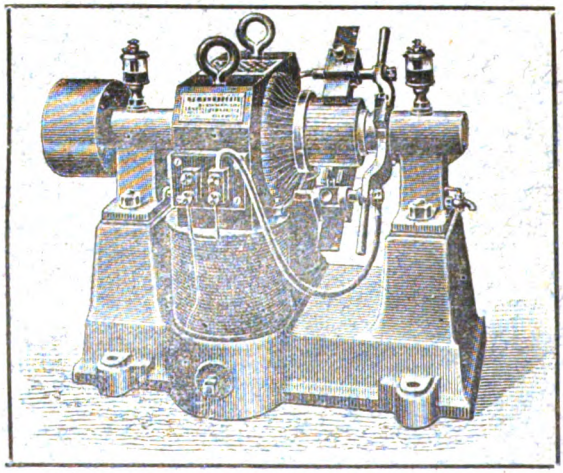
Arc Lighting,

Incandescent Lighting,

Transmission of Power,

ETC.

From 4 Lights



Made for Hard Work, Long-Continuous Running, Low Speed, Small Rise of Temperature.

To 1,000 Lights.

A VERY HIGH-CLASS MACHINE AT A MODERATE PRICE.

SEND FOR PRICES AND PARTICULARS TO

GARDNER & SONS, ELECTRICAL ENGINEERS,

CORNBROOK, MANCHESTER.

SPECIAL TERMS TO THE TRADE.

THE BRITISH ELECTRIC LIGHT COMPANY LIMITED * 1878 *

Telegraphic Address: "Turncocks London."

The British Electric Light Co.,

LIMITED. INCORPORATED 1878.

Gold Medal, Paris International Electrical Exhibition, 1881.
Gold Medal, Crystal Palace Electrical Exhibition, 1882.

THE OLDEST ELECTRIC LICHT COMPANY IN ENGLAND.

This Company undertakes installation work of every description, either for cash payment or for a fixed yearly rental, for a term of years, the Company keeping the whole of the necessary plant and fittings in proper working condition during such term.

Tenders will be submitted for all classes of work free of charge, and for this purpose the Company's Engineer will inspect any premises before tendering.

After the expiration of the Edison patent the Company will supply their "British" and "British Economic" Glow Lamps of high efficiency.

Application to be made to the Secretary, at the offices of the Company—

11, DELAHAY STREET, WESTMINSTER, S.W.

C. C. MacCARTHY,

Electrical & Mechanical Engineer, Manufacturer & Contractor,

THE BELFAST ELECTRICAL WORKS,

23, Corporation Square, and 16, William Street South,

BELFAST.

LAMP HOLDERS, best make, royalty paid. Write for prices and samples. (A speciality.)

DYNAMOS: HIGHEST EFFICIENCY, LOWEST PRICES.

Installations erected complete, Dynamo included, 100 lights, 16 c.p., £150.

DAVEY, PAXMAN & CO., Engineers, COLCHESTER,

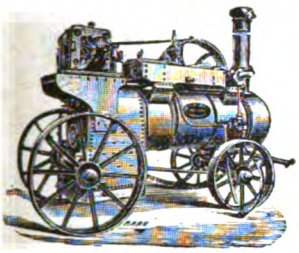
MAKERS OF

ENGINES & BOILERS

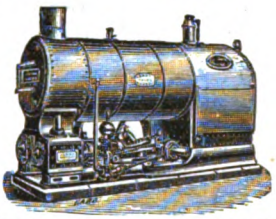
SUITABLE FOR

MILLS, FACTORIES, ELECTRIC LIGHT INSTALLATIONS, &c., &c.

Telegraph Address:
"PAXMAN, COLCHESTER."



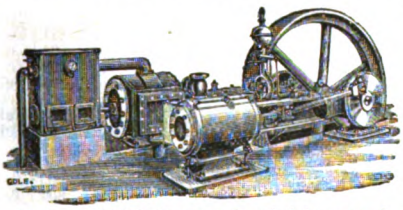
Portable Engine, with Dynamo attached, up to 60 H.P.



Semi-Fixed Compound Engine and Boiler, up to 200 H.P.

MAKERS OF

COMPOUND HORIZONTAL FIXED ENGINES.
'WINDSOR' HIGH SPEED COMPOUND AND NON-COMPOUND VERTICAL ENGINES.
CORNISH, LANCASHIRE, 'ECONOMIC' SAFETY, WATER TUBE, 'ESSEX' VERTICAL, AND ALL KINDS OF BOILERS.



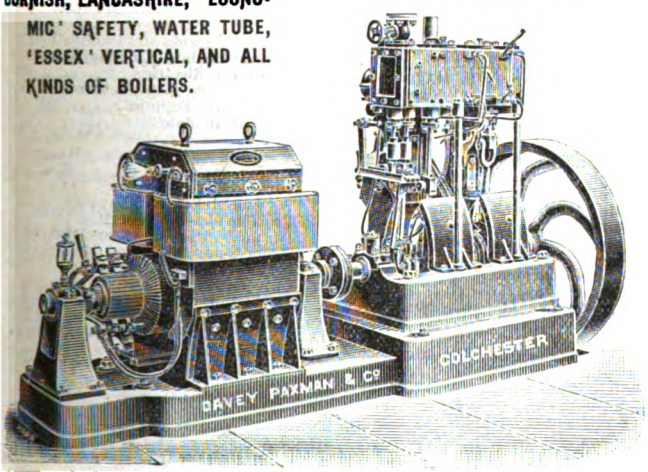
Horizontal High-Pressure Coupled Compound Engine. 8 to 100 H.P. nom.

MAKERS OF

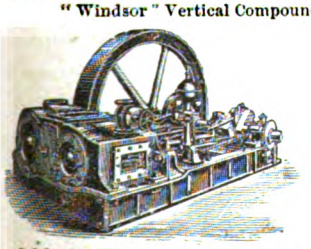
SEMI-FIXED ENGINES & BOILERS.
HORIZONTAL ENGINES.
VERTICAL ENGINES & BOILERS.
HORIZONTAL WINDING ENGINES.
VERTICAL HOISTING ENGINES & BOILERS.
COMPOUND PORTABLE & SEMI-PORTABLE ENGINES.
TRIPLE EXPANSION ENGINES.

D., P. and Co.'s Engines are fitted with Paxman's Patent Automatic Expansion Gear and Adjustable Governors which ensures a steady and constant speed in any emergency.

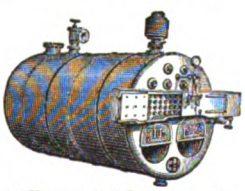
This Gear is one of the greatest and most modern improvements effected in the steam engine.



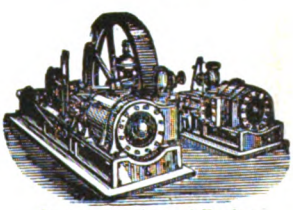
"Windsor" Vertical Compound Engine with Dynamo combined.



Colchester Horizontal Compound Engine. From 8 to 350 H.P.



"Economic" Boiler, up to 350 H.P.



Compound Horizontal Engine. 40 to 200 H.P. nom.

CATALOGUES, PHOTOS, PRICE LISTS, AND FULL PARTICULARS POST FREE ON APPLICATION TO

USEFUL WORKS FOR ELECTRICIANS.

PUBLISHED BY CROSBY LOCKWOOD & SON.

Crown 8vo, 624 pages, with 350 Illustrations, 12s. 6d., Cloth.

THE STANDARD ELECTRICAL DICTIONARY

A POPULAR DICTIONARY OF WORDS AND TERMS USED IN THE PRACTICE OF ELECTRICAL ENGINEERING.

CONTAINING UPWARDS OF 3,000 DEFINITIONS.

BY PROF. T. O'CONOR SLOANE,

Author of "Arithmetic of Electricity," "Electricity Simplified," "Electric Toy-Making," &c.

"The work has many attractive features in it, and is, beyond doubt, a well put together and useful publication. The volume is one which does the author great credit, and should prove of great value, especially to students."—*Electrical Review.*

"An encyclopædia of electrical science in the compass of a dictionary. The information given is sound and clear. The book is well printed, well illustrated, and well up to date, and may be confidently recommended."—*Builder.*

Crown 8vo, with nearly 100 Illustrations, 7s. 6d., Cloth.

THE ELECTRIC TRANSFORMATION OF POWER

AND ITS APPLICATION BY THE ELECTRIC MOTOR,

INCLUDING

ELECTRIC RAILWAY CONSTRUCTION.

BY PHILIP ATKINSON, A.M., PH.D.

Crown 8vo, with 88 Illustrations, 7s. 6d., Cloth.

ELECTRIC SHIP LIGHTING: A Handbook on the Practical Fitting and Running of Ships' Electrical Plant. For the Use of Ship-owners and Builders, Marine Electricians, and Sea-going Engineers-in-Charge. By J. W. URQUHART, C.E.

"A plain, practical, and serviceable book, valuable to working engineers. The clearness of description and exposition is admirable. The book will have a hearty welcome from practical electricians."—*Scotsman.*

Second Edition, Enlarged, Crown 8vo, 5s., Cloth.

ELECTRIC LIGHT FITTING: A Handbook for Working Electrical Engineers, embodying Practical Notes on Installation Management. By JOHN W. URQUHART, C.E.

"This volume deals with what may be termed the mechanics of electric lighting, and is addressed to men who are already engaged in the work, or are training for it. The work traverses a great deal of ground, and may be read as a sequel to the same author's useful work on 'Electric Light.'"—*Electrician.*

Fifth Edition, Revised, with Additions, Crown 8vo, with 145 Illustrations, 7s. 6d., Cloth.

ELECTRIC LIGHT: Its Production and Use, Embodying Plain Directions for the Treatment of Dynamo-Electric Machines, Batteries, Accumulators, and Electric Lamps. By J. W. URQUHART, C.E.

"The whole ground of electric lighting is more or less covered and explained in a very clear and concise manner."—*Electrical Review.*

Crown 8vo, with 100 Illustrations, 7s. 6d., Cloth.

DYNAMO CONSTRUCTION. A Practical Handbook for the Use of Engineer Constructors and Electricians-in-Charge. By J. W. URQUHART, C.E.

"Mr. Urquhart's book is the first one which deals with these matters in such a way that the engineering student can understand them. The book is very readable."—*Engineering Review.*

Just Published, Second Edition, Revised, with Additions, Royal 32mo, 5s., Leather.

THE ELECTRICAL ENGINEER'S POCKET-BOOK OF MODERN RULES, FORMULÆ, TABLES, AND DATA. By H. R. KEMPE, M.Inst.E.E., A.M.Inst.C.E., Author of "A Handbook of Electrical Testing," &c.

"There is very little in the shape of formulæ or data which the electrician is likely to want in a hurry which cannot be found in its pages."—*Practical Engineer.*

Crown 8vo, with 120 Illustrations, 10s. 6d., Cloth.

THE ELEMENTS OF DYNAMIC ELECTRICITY AND MAGNETISM. By PHILIP ATKINSON, A.M., Ph.D., Author of "The Elements of Electric Lighting," &c.

"A book for learners rather than for the learned, being clear in style and amply illustrated. The book is very readable and just what the general reader wants."—*Electrical Engineer.*

Third Edition, Crown 8vo, 1s. 6d., Cloth.

THE ELEMENTARY PRINCIPLES OF ELECTRIC LIGHTING. By ALAN A. CAMPBELL SWINTON, Associate I.E.E.

New Catalogue of Scientific and Technical Books on Application.

London: CROSBY LOCKWOOD & SON,

7, Stationers' Hall Court, Ludgate Hill, E.C.

TWELFTH YEAR'S ISSUE.

PREFACE.

IN issuing this, the Twelfth Edition of our annual DIRECTORY AND HANDBOOK, we have again to renew the Editors' and Publisher's acknowledgments and thanks for the assistance and support they have received from the Electrical Trades generally, both at home and abroad. As regards the reference DIRECTORY it is as complete and authentic as our best efforts can make it, and in these respects it has won a high place in the ranks of Trades' Directories of every kind. If there are any shortcomings we may confidently plead that the fault rests with the parties concerned, who, through forgetfulness or inadvertence, fail to put us in possession of the needful information or correction in time for publication. These omissions, however, become fewer each year as the importance of publicity becomes more and more fully recognised; and this present year's issue leaves little room for criticism in this respect.

The enlarged space occupied by the DIRECTORY section of the work affords gratifying evidence of the unceasing growth of the Electrical and allied Trades, of their increasing activity, and of their tendency to group themselves into a commercial union lending power and dignity to their combined industries when dealing with Governments and Municipalities. To these advantages the Colonies and the Continent have contributed not a little; and we have this year given them greater prominence by assigning them separate sections, more easily distinguished and handier for reference. We have reason to believe that ours are the only Colonial and Continental lists accepted as trustworthy by the trade, and we take this opportunity of thanking the Colonial and Continental Press for their unstinted appreciation of our efforts in this difficult work.

Several fresh statistical and electrical tables of interest and importance to professional electricians and electrical traders have been embodied in

Digitized by Google

the present volume, together with other new matter arising out of electrical developments or legal pronouncements during the past year. On the other hand, a judicious elimination has been made of matter which has taken a permanent place in standard works of the day, or has grown out of date, or been superseded by later experiments and research.

To keep our clients well informed of the best and latest in respect of all particulars likely to be useful to them and to advance the progress of electrical science and manufacture, has been our constant endeavour; and that we have succeeded in these efforts may be fairly assumed from the ever-increasing bulk of its pages and the not less increasing prosperity of "THE ELECTRICIAN" ELECTRICAL TRADES' DIRECTORY AND HANDBOOK. The Advertisers in this Edition may be claimed as the most representative firms in the Allied Industries, and Government Departments, Municipal Authorities, and Wholesale and Retail Dealers may confidently refer to the Index of manufacturing firms, &c., on pages 53 and 54, with the full assurance that the names there set out are the principal makers of Electrical and General Engineering Plant, Apparatus and Appliances.

Latimer Clark, Muirhead & Co.,

LIMITED,

ELECTRICAL ENGINEERS,

23, REGENCY STREET, WESTMINSTER, S.W.

MANUFACTURERS OF

Machinery and Apparatus for Electric Lighting and Transmission of Power.

Dynamos, Motors, Arc Lamps, Incandescent Lamps, Switchboards, Switches, Fuses, Carbons, Cables and Leads, &c.

THE "WESTMINSTER" DYNAMOS,

AS SUPPLIED TO H.M. NAVY.

They are made in all sizes. The highest efficiency and best workmanship guaranteed. Price List on application.

Search Light Projectors (Admiralty and Commercial Pattern); **Automatic Projectors and Automatic Projector Lamps; Electrical Measuring Instruments of every description; Patent Ammeters, Voltmeters, Wattmeters, Ergmeters, Ohmmeters, Dynamometers, &c.**

TELEGRAPH APPARATUS

OF EVERY DESCRIPTION.

LAND LINE MATERIAL.—Muirhead Compound Pole, Insulators, &c.

SUBMARINE Telegraph Apparatus; Muirhead's Patent Duplex and Quadruplex Apparatus and Artificial Cable, as used by all the principal Cable Companies; Saunders' Signalling Key, and Smith's Switch, Signalling and Testing Instruments.

GALVANOMETERS.—Latimer Clark's Differential, Sir William Thomson's, and new improved D'Arsonval reflecting, Marine Galvanometers; Siemens' Astatic Galvanometer and Detector.

RESISTANCE BOXES, with coils of Platinum Silver and German Silver; Latimer Clark's Potentiometer Meter Bridge; Blackburn's Portable Testing Apparatus; Mance's Patent Testing Apparatus for Cable work.

CONDENSERS AND ELECTRICAL STANDARDS of every description; Clark's Standard Element; Liveing's Patent Gas Indicator.

CABLES AND WIRES of every description for Electric Lighting, Telegraphy, or Instrument Making.

SHIPS' TELEGRAPHS AND SPEED INDICATORS

AS SUPPLIED TO H.M. NAVY.

ENGINEERING WORK OF ALL DESCRIPTIONS.

Telegraph Address: "REGENCY LONDON."

THE

PHONOPORE TELEGRAPH.

THIS ingenious apparatus is simply attached, by a wire, to an existing Telegraph wire, either at the Terminals or at any part of the Circuit required. It may be carried over two or more Circuits, and gives in all respects an equivalent to the erection of a new line wire between the places where it is used, saving the cost of an additional wire, interest on the outlay, and annual maintenance of that additional wire; and supplies an additional service, which can be worked **simultaneously with, and absolutely independent of, any ordinary simplex or duplex telegraph service already in operation on the wire.**

It is worked by an ordinary Morse Key, and its signals are the ordinary Morse Code.

It is working very satisfactorily on several of the principal lines of Railway, and its use is now being extended on account of the advantages and economy it affords

It has on several occasions, when the line wire has been broken by storm, frost, or otherwise, rendering the ordinary Telegraph useless, maintained communication on the wire (although broken) on which it has been installed.

TELEPHONES.

The application of this system is now applied to Telephones, by which a distinct Telephonic Communication can be established between Railway Signal Cabins and Stations on the existing Bell, Block, or Train staff wires, without the least interference with the working of either system. It has been approved by the Inspectors of the Board of Trade, and its adoption is rapidly growing both at home and abroad.

THE PHONOPORE COMPANY, Ltd.,

Are prepared to supply, and, if desired, to instal

COMPLETE PHONOPORE TELEGRAPH SERVICES ON WORKING LINES.

THE PHONOPORE TELEGRAPH,

Working simultaneously with the ordinary Telegraph on the same wire, can be seen on application to THE SECRETARY OF

THE PHONOPORE COMPANY,

LIMITED,

FARADAY HOUSE, CHARING CROSS ROAD, W.C.,

FROM WHOM ALL FURTHER PARTICULARS CAN BE OBTAINED.

AN INSPECTION IS INVITED.

SUMMARY OF ELECTRICAL EVENTS FOR 1893.

JANUARY.

The Australian Cable Rates raised at the request of the Colonial Governments (1st).
The Austrian Government took over the Exchanges of the Telephone Company of Austria (Limited) (1st).
Judgment given in the Action for Infringement brought by Dr. John Hopkinson against the St. James' and Pall Mall Electric Light Company. Mr. Justice Romer decides that Dr. Hopkinson's Three-Wire Patent, No. 3,576, of 1882, is valid (14th).
Opening of the Hull Municipal Central Station (16th).
Expiry of the Blake Telephone Transmitter Patent, No. 229, of 1879 (20th).
Publication of an Interim Report by the Royal Commission on Coast Communication recommending five Lightships and a certain number of Rock Lighthouses to be electrically connected with the shore (31st).
A Sub-Committee of the Glasgow Corporation report that they are of opinion that the disadvantages of electric traction outweigh its advantages.
Delivery by Prof. W. Cawthorne Unwin of a course of Howard Lectures on "The Development and Transmission of Power from Central Stations."
Belgian Telephone System taken over by the Government.
The American Institute of Electrical Engineers publish a series of important proposals with regard to the forthcoming International Electrical Congress at Chicago.
Dividends declared:—St. James' and Pall Mall Electric Light Company, 7¼ per cent.; Anglo-American Telegraph Company, 2¾ per cent.; Newcastle-upon-Tyne Electric Supply Company, 4 per cent.

FEBRUARY.

Expiry of the Crossley Telephone Transmitter Patent, No. 412, 1879 (1st).
Death of Mr. J. E. H. Gordon and M. van Rysselberghe (3rd).
Inauguration of the Liverpool Overhead Railway by the Marquis of Salisbury (4th).
Judgment given in favour of the Leeds Electric Cars by Mr. Justice Kekewich (National Telephone Company *v.* Graff Baker) (4th).
Opening of the Boston-Chicago Telephone Trunk Wire (1,200 miles long) (7th).
The price of the Board of Trade Unit reduced by the St. James' and Pall Mall, and Westminster and London Electric Companies, to 6d., with sliding scale discount down to a minimum of 5d.
New form of glow lamp with removable stopper, iron leading-in wires, and bottle-neck, brought out by the Westinghouse Company of America.
Death of Dr. Norvin Green, President of the Western Union Telegraph Company of America.
In an Action brought in America by the General Electric Company against the Beacon Vacuum Pump and Electric Company, the latter brought forward the Göbel Lamp as an anticipation of Edison's; Judge Colt decided that the Göbel Lamp did not warrant stay of preliminary injunction.
The Glasgow Municipal Electric Lighting Central Station comes into operation.

Digitized by Google

Remarkable results in the reduction of refractory ores obtained by M. Henri Moissan by means of the electric furnace.

Meeting of the National Electric Lighting Association at St. Louis.

Dividends declared :—Kensington and Knightsbridge Electric Lighting Company, 4 per cent.; Telegraph Construction and Maintenance Company, 15 per cent.; Westminster Electric Supply Corporation, 3½ per cent.; Newcastle and District Electric Lighting Company, 5½ per cent.; Electricity Supply Corporation, 5 per cent.; India-Rubber, Gutta Percha and Telegraph Works Company, 7½ per cent.; Chelsea Electricity Supply Company, 2½ per cent.; Liverpool Electric Supply Company, 5 per cent.; Birmingham Electric Supply Company, 3½ per cent.; Keswick Electric Light Company, 2 per cent.

MARCH.

The Liverpool Overhead Electric Railway opened to the public (6th).

A motion in the House of Commons by Mr. Pickersgill to secure the insertion of a London County Council Purchase Clause in the City and South London Railway Bills defeated by a large majority (9th).

Tramway clauses in the Salford Corporation Improvement Bill withdrawn owing to the demand of the National Telephone Company for a protection clause (16th).

A Select Committee of the House of Commons decide that the preamble of the Clapham Junction and Paddington Railway Bill is not proved. Great opposition was offered by the authorities of the Central Institution and Royal College of Science to the line being taken up Exhibition-road within a few feet of the laboratories (20th)

Shareholders vote the voluntary winding up of Woodhouse and Rawson United (Limited) (20th).

Papers by Mr. C. K. Falkenstein, entitled "Notes on the Influence of Electricity in Tanning Operations," read before the Institution of Electrical Engineers (23rd).

Rejection of the Kilburn-Victoria Electric Railway Bill by a Select Committee of the House of Commons (24th).

Agreement signed between the Coventry Town Council and Mr. Graff Baker with regard to the working of the tramway system by electricity (31st).

Issue by the Board of Trade of an important memorandum on the effect of using glow-lamps in ships' side lights.

Publication of the Report of the Committee of Investigation appointed by the shareholders of Woodhouse and Rawson United (Limited).

Dundee Municipal Electric Lighting Station comes into operation.

The National Telephone Company announced certain reductions in their London tariffs.

Edison "Feeder" patent upheld in the United States.

Dividends declared :—W. T. Henley's Telegraph Works Company, 5 per cent.; Direct Spanish Telegraph Company, 4 per cent.; Anglo-Portuguese Telephone Company, 5 per cent.

APRIL.

Laying of a Post-Office Telephone Cable between Port Kail and Donaghadee (4th).

The shareholders of Elmore's French Patent Copper Depositing Company (Limited) vote its voluntary winding up (6th).

Death of Mr. C. V. de Sauty (11th).

Paper on "Distribution of Power by Alternate-Current Motors," read before the Institution of Electrical Engineers by Mr. Albion T. Snell (13th).

Digitized by Google

The Islington Vestry decide to undertake electric lighting (18th).
Friday Evening Discourse at the Royal Institution by Prof. A. B. W. Kennedy, on "Possible and Impossible Economies in the Utilisation of Energy" (21st).
The Leicester Town Council decide to accept the Brush Company's tender for a municipal plant on the alternate-current transformer sub-station system (25th).
The Edinburgh Town Council decide to undertake electric lighting (25th).
The Glasgow Town Council appoint a Special Committee "to consider the question of applying to the Postmaster-General for a licence to supply the community with an efficient telephone service."
Dividends declared:—Eastbourne Electric Light Company, 3 per cent.; Metropolitan Electric Supply Company, 2 per cent.; Hastings and St. Leonard's-on-Sea Electric Light Company, 5 per cent.; Eastern Extension Telegraph Company, 7 per cent.; Indo-European Telegraph Company, 10 per cent.; Great Northern Telegraph Company, 8·6 per cent.; London-Platino-Brazilian, 2 per cent.; New Shanghai Electric Light Company, 7 per cent.; Western Brazilian Telegraph Company, 2½ per cent.; Submarine Cables Trust, 6 per cent.

MAY.

The Faure Accumulator patent upheld by the Court of Appeal in France (5th).
Death of Sir James Anderson (7th).
Paper by Mr. W. B. Sayers, entitled "On the Prevention and Control of Sparking: Continuous-Current Dynamos without Winding on the Field-Magnets, and Constant-Pressure Dynamos without Series Winding," read before the Institution of Electrical Engineers (11th).
Death of Prof. Moses G. Farmer, at Chicago (25th).
Halifax and Ealing decide to borrow £30,000 and £25,000 respectively for electric lighting purposes.
Cardiff authorised to spend £32,500 on electric lighting.
Dividends declared:—Reuter's Telegram Company, 5 per cent.

JUNE.

Important Presidential Address dealing with Gas and Electricity, delivered by Mr. Denny Lane to the Incorporated Gas Institute, at Belfast (13th).
Inquiry by a Joint Committee of both Houses of Parliament as to the telephone protective clauses which should be inserted in private Bills relating to electric traction (19th, 20th, 21st, 22nd, 23rd, 26th, and 27th).
Action brought against the St. James' and Pall Mall Electric Light Company by the trustees of the Windham Club for nuisance, settled out of Court; similar action brought against the Electricity Supply Corporation was given in its favour.
Sanction given to electric lighting loans: Aberdeen, £20,000.
Dividends declared:—Electric and General Investment Company, 25 per cent.; Consolidated Telephone Construction and Maintenance Company, 2 per cent.; Eastern Telegraph Company, 6½ per cent.

JULY.

Publication of the Report of the Joint Committee on Electric Powers (Protective Clauses). Tramways obliged to use insulated or uninsulated returns, telephones to metallicise their circuits (13th).

Digitized by Google

Action brought by a Strand clockmaker against the Electricity Supply Corporation for damages and an injunction, resulted in the jury deciding that while there was vibration it was very slight (14th).

Death of M. Marié Davy (16th).

Death of Mr. S. E. Phillips (22nd)

The Commissioners of Sewers decide to sanction the running of telephone wires in the spare tubes of the City of London Electric Lighting Company only upon condition that double-wire circuits, good instruments, and £8 rentals are guaranteed (25th).

Opening of the Huddersfield Municipal Central Lighting Station (29th).

The Tunbridge Wells Town Council decide to adopt an electric lighting scheme costing £13,000.

Death of Mr. Oliver Smith.

Dividends paid :—National Telephone Company, 5 per cent.; Direct United States Cable Company, 3½ per cent.; Globe Telegraph and Trust Company, 4⅝ per cent.; Sheffield Electric Light and Power Company, 5 per cent.; Edison-Swan United Electric Light Company, "A" shares, 10 per cent.; Oriental Telephone and Electric Company, 2¼ per cent.; Manchester Edison-Swan Company, 5 per cent.

AUGUST.

The Manchester Municipal Electric Lighting Station comes into operation (1st).

The Glasgow Town Council adopt the recommendation of their Telephone Committee and decide to apply to the Postmaster-General for a telephone licence (3rd).

International Electrical Congress held at Chicago. Important Papers were read by Prof. Ayrton on Phenomena connected with the Electric Arc, and by Prof. Silvanus Thompson on Ocean Telephony; and an International System of Electrical Units and Nomenclature was adopted (21st-25th).

The Southport and Cheltenham Town Councils decide to adopt the high-pressure system of electric lighting; the Stafford Town Council decide to adopt the low-pressure system of electric lighting; and the Worcester and Coventry Town Councils definitely decide to adopt the alternate-current high-pressure system.

The Zipernowsky-Déri patent for running transformers in parallel, and the Zipernowsky-Déri-Bláthy patent for closed magnetic circuit transformers upheld by the Court of Appeal in France.

The Postmaster-General refuses to grant a telephone license to the Glasgow Corporation.

Cable laid by the Telegraph Construction and Maintenance Company between Lisbon (Portugal) and the Azores.

Dividends declared :—Electrical Power Storage Company, 5 per cent.; Cuba Submarine Telegraph Company, 8 per cent.; Brush Electrical Engineering Company, 6 per cent.

SEPTEMBER.

Opening of the Municipal Electric Lighting Station at Whitehaven (2nd)

Opening of the Stockholm-Christiania Telephone trunk line (2nd).

Opening of the British Association Meeting at Nottingham (13th).

Postmaster-General promises to present the Agreement between the Post Office and the National Telephone Company to the House of Commons in November (19th).

Death of Mr. H. Weaver (20th).

Reduction of the price of glow lamps by the Edison-Swan United Company, from 3s. 9d. to 1s. 9d. (21st).

Digitized by Google

Bill introduced into the United States Senate directing experiments to be made with a view to the establishment of electrical communication with outlying lighthouses and lightships.

OCTOBER.

Death of Sir Arthur Blackwood, Secretary to the Post Office (4th).
Opening of the Derby Central Station (10th).
Opening of the Queensland-New Caledonia Cable (19th).
Important Paper on "The Artificial Lighting of Workshops" read by Mr. B. A. Dobson before the Institution of Mechanical Engineers (25th).
Inauguration of the Blackpool Municipal Station by Lord Kelvin.
Bolton municipal electric lighting loan of £40,000 sanctioned by the Local Government Board.
The Electricity Department of the Bradford Corporation report a net profit for the financial year, after payment of interest, sinking fund and arrears, of £1,269.
Dewsbury municipal electric lighting loan of £25,000 sanctioned by the Local Government Board.
Salford municipal electric lighting loan of £32,000 sanctioned by the Local Government Board.
Dividend declared:—Brazilian Submarine Telegraph Company, 6 per cent., plus a bonus of 1s. per share.

NOVEMBER.

Opening of the Kingston-on-Thames Municipal Electric Lighting Station (4th).
Paper on "The Electrical Transmission of Power from Niagara Falls" read before the Institution of Electrical Engineers by Prof. George Forbes (9th).
Expiry of the Edison Lamp Patent, No. 4,576 of 1879 (10th).
Issue of Draft Electric Tramway Regulations by the Board of Trade (22nd).
Mauritius cable opened for traffic (23rd).
Statement made by the Postmaster-General in the House of Commons that the loss upon press telegrams amounted to at least £300,000 a year (27th).
Death of Mr. Anthony Reckenzaun.
Strike of Italian telegraph clerks.
The Kensington Vestry reject a proposed municipal electric lighting scheme by a large majority.

DECEMBER.

Death of Prof. Tyndall (4th).
The Coventry Town Council accept the electric lighting tender of Messrs. John Fowler & Co., Leeds, and decide to borrow £20,000 for the purpose of carrying it out (5th).
The City Commissioners of Sewers decide to remove the gas lamps in all streets lighted by electricity (6th).
Formation of a Governmental Committee at Paris to inquire into the subject of the extension of the French telegraph system, more especially of the French cable system.
Statue of Joule in the Manchester Town Hall unveiled by Lord Kelvin (8th).
Death of Sir George Elliot (23rd).
Formation of the Northern Society of Electrical Engineers.
Death of Henry Göbel, deemed by some to be the inventor of the incandescent lamp.
Foundation stone of the Bolton Corporation Electricity Works laid.
Loan of £15,000 for carrying out a municipal electric lighting scheme at Yarmouth sanctioned by the Local Government Board.
Dividends declared:—Swan United Electric Light Company, 7½ per cent.

OBITUARY NOTICES.

THE following is a record of the losses sustained by Electrical Science and Industry during 1893. The obituaries are in most cases compiled from the columns of *The Electrician*:—

Anderson, Sir James, J.P., F.R.G.S., F.G.S., F.S.S.—The death of Sir James Anderson, which took place on May 7th, after an illness of nearly three months' duration, removed an eminent figure from the submarine telegraph world. Sir James Anderson was born at Dumfries in 1824, joined the Merchant Service at the age of 16, and made several voyages to India and the West Coast of America. A few years later he went with his ship to Natal, Mauritius, Bombay, and traded between China and the Persian Gulf. In 1851 he entered the important service of the Cunard Steamboat Company, and commanded successively fourteen vessels belonging to that extensive company in the Mediterranean and the Atlantic. When the Telegraph Construction and Maintenance Company was formed for the purpose of laying the second Atlantic cable, the first having been irretrievably lost, the "Great Eastern" steamship was chartered to do the work, and it became a question as to who should command that ship. The choice fell on Capt. Anderson. In the first voyage of the "Great Eastern" the cable parted, and Capt. Anderson attempted to pick it up. He found, however, that the machinery at his disposal was not equal to the work, but felt confident that, with proper appliances, he could pick up the cable from the great depths of the Atlantic. On the return of the ship, Capt. Anderson so impressed the Directors of the Telegraph Construction Company with his views that they individually largely subscribed to the necessary capital, and the Board determined not only that the ship should be sent out to recover the cable that was lost, but also that a second cable should be laid, if they could find the amount of money necessary to enable them to have one manufactured. In both these projects they were entirely successful. The ship went to sea under Capt. Anderson's command, laid the new cable, and picked up the cable broken the previous year. For carrying out this important operation Capt. Anderson received the honour of knighthood. The fact that cables could be picked up from such great depths and repaired gave a wonderful impulse to submarine telegraphy. Sir James Anderson saw that there was a great future for it, and from that time he identified himself with the small band of men who have been the pioneers of submarine telegraphy. At the time of his death Sir James Anderson—whose connection with telegraphy has been fraught with most happy results for submarine telegraphy, he being an authority on cable matters—was Managing Director of the Eastern Telegraph Company, the Eastern and South African Telegraph Company, and the West African Telegraph Company; he was Chairman of the Brazilian Submarine and Direct Spanish Telegraph Companies, and a Director of the Anglo-American, the African Direct, the Eastern Extension, and the West India and Panama Telegraph Companies, and a Trustee of the Globe Telegraph and Trust Company. He was also a Director of the Metropolitan Electric Supply Company, and a Trustee of the Submarine Cables Trust. Sir James was a member of the Statistical Society, before whom he read a Paper on "Statistics of Telegraphy," afterwards publishing a book under the same title, which is regarded as an authority on the subject. He wrote also Papers on

Digitized by Google

"Cables in Time of War," "The Government Purchase of Submarine Cables and Reduction of Telegraph Rates," "The Telegraphic Communication of the Empire and a Comparison of the Various Routes to the East." Sir James long advocated an "Authorised Vocabulary" from which the words used in code messages should be taken, and it was due to his efforts in this direction that the last International Telegraphic Conference decided to compile an official list of words to be used in codifying telegrams, which will be published this year. It can be said of Sir James Anderson that he endeared himself to all who came in contact with him. Endowed with a large measure of sterling common sense, of genial presence, possessed of the utmost kindness of heart, and availing himself of unnumbered opportunities of doing good to many besides those who had the honour of serving under him, he will be long remembered with very sincere affection and respect.

Archereau, Henry-Joseph.—The death of M. Henry-Joseph Archereau at the age of seventy-three occurred in February. M. Archereau made a name for himself in the middle of the century by his work on the Bunsen cell, and by his arc lamp. M. Archereau came to Paris in the last years of the reign of Louis-Philippe, and in 1849 made the sensible and obvious improvement to the Bunsen cell of placing the carbon inside and the zinc outside the porous pot, thus rendering the moulding of carbon cylinders unnecessary. He, at the same time, substituted retort carbon for the agglomerate carbon of Bunsen. About the time that M. Archereau came upon the scene many people were at work upon the task of getting rid of the noxious fumes given off by the nitric acid cell. Some tried hermetic sealing; others absorbents, such as oleic acid. M. Archereau attempted with but moderate success to overcome the defect by placing an inverted vessel containing iron filings over the cell. Another device of M. Archereau was an elaborate contrivance for filling and emptying large electric lighting batteries of a hundred or more cells, which could, it was claimed, be filled in this way in five minutes. In 1850, M. Archereau brought out an arc lamp in which the lower carbon holder was actuated by an iron-copper core moving within a helix of wire traversed by the main current, the balance being maintained by a counter-weight. Fortune did not smile on M. Archereau, but for many years he was maintained in comparative comfort by the liberality of the late M. Gaston Planté. A few years ago M. Archereau's friends got up a subscription on his behalf, but the small sum realised was wasted on profitless inventions, and M. Archereau finally died in misery.

Cowper, Edward Alfred.—By the death of Mr. E. A. Cowper in May a well-known figure was removed from Westminster, and the already scant number of engineers of the old school was reduced. Only a few weeks before his death he was taking part in the discussion at the Institution of Civil Engineers on the Paper by the late Mr. Willans, and characteristically advocated the use of the well-understood Prony brake instead of the rather mysterious dynamo for testing engines, nor did he let the opportunity pass for insisting, as he was wont, on the advantages of the steam jacket. Mr. Cowper served a seven-years' apprenticeship at the works of John Braithwaite, of St. Pancras, which he entered at the age of 14 in 1834. In 1847 he assisted in founding the Institution of Mechanical Engineers, becoming an original member of council, and was President in 1880-81. After active work with Messrs. Fox and Henderson he started in practice as a consulting engineer in 1851, joining in the following year the Institution of Civil Engineers, in the affairs of which he continued to take so active a part up to the last. In about 1857, after giving great attention to the subject of the economy of steam, he introduced the jacketted reservoir for compound engines with the cranks at right angles. This invention, well known as "Cowper's hot-pot," was applied to H.M.S. "Briton" in 1870; the coal consumption on the trial was 1·3lb. per horse-power per hour. Mr. Cowper was a thoroughly practical mechanical engineer, and had strong inventive abilities. He became a member of the Institution of Electrical Engineers in 1879, but did not concern himself much with electrical work. In

Digitized by Google

this year, however, he invented the writing telegraph, an instrument which in principle is identical with the very latest apparatus proposed for this purpose. To all who were in the habit of attending the meetings of the Institution of Civil Engineers, Mr. E. A. Cowper was one of the best known members of council. It was the exception if he did not take part in the discussion on a Paper dealing with a mechanical subject, and he always had some bit of experience to recall, and often an invention of his own to describe with which to illustrate in a most practical manner the topic of the evening. In 1887, in conjunction with Dr. W. Anderson, he made a determination of Joule's equivalent on a large scale, a 5 H.-P. engine being run on a Froude dynamometer for many hours. The times are altering, and such men of mechanical instinct and long experience in a definite branch of a wide profession are becoming rare. The rising generation is more ready to display a knowledge of theory, to spend its strength on the last new thing, and to attempt to cover a wide range; may it give rise to a few men of the sound common sense of Mr. E. A. Cowper.

Cracknell, E. C.—Mr. E. C. Cracknell, Superintendent of the New South Wales Government Telegraphs, died at Sydney on January 14th, after a very short illness. Mr. Cracknell was born at Oxford in 1831, and proceeded to Sydney about the year 1855, where he organised the telegraph system in New South Wales, and remained at its head until his decease. His last visit to Europe was in 1885, when he attended the Telegraph Conference at Berlin.

De Sauty, Charles Victor.—The death, at the age of 63, of Mr. Charles Victor de Sauty took place from paralysis on April 11th at Gibraltar, where he was Superintendent of the Eastern Telegraph Company. Mr. De Sauty was born in 1830, and after some time spent in a solicitor's office, entered the Submarine Telegraph Company's service. In 1856 he joined the original Atlantic Telegraph Company, and was Superintendent of the Newfoundland Station during the short period the cable worked in 1858, and in the laying of which cable he took part as electrician. In 1859 he joined the firm of Glass, Elliot and Co., afterwards the Telegraph Construction and Maintenance Company, as their chief electrician, and was engaged upon all the expeditions for the laying of that firm's cables up to 1865, including the Atlantic cable of that year. He then went to New Zealand, and was in charge of the Government Telegraphs there until 1870, when he entered the service of the Falmouth-Gibraltar and Malta Telegraph Company, which was afterwards amalgamated, with three other cable companies, into the Eastern Telegraph Company. Although Mr. De Sauty had no regular training in that direction, he was a most ingenious mechanician, and kept well in the van of all the early development of electrical science and submarine telegraphy, in proof of which may be cited his method for the comparison of electrostatic capacity, which was the earliest differential method used for that purpose, and contained within it the elements of the duplex. Mr. De Sauty was largely concerned in the practical development of the duplexing of cables, which was finally perfected by the introduction of Dr. Alexander Muirhead's condensers. His name was better known on the American side, in connection with the laying of the first Atlantic cables, than that of any other member of the scientific staff, as is evidenced by the quaint but little known verses of Dr. Oliver Wendell Holmes. Mr. De Sauty was a man of strong personal character, expressing his opinions very plainly, and one of the staunchest friends it was possible to have.

Elliot, Sir George.—The death of Sir George Elliot, Bart., well known in the electrical world on account of his early connection with submarine telegraphy, occurred on Saturday, December 23rd. Sir George Elliot was a typical Englishman. Born at Gateshead in 1815, he began life at the bottom of a coal-pit, and worked through every stage of the industry with which his name was so widely connected. He early succeeded in creating for himself a fortune, which

Digitized by Google

enabled him to take the place and exercise the influence belonging to energy of character, and shrewd, practical intelligence. In 1849 he acquired the business of Messrs. Kuper and Co., wire-rope makers, from the assignees of the firm, paying off their liabilities in full, and giving a handsome sum to Messrs. Kuper for the reversion. In this business he invited Mr., afterwards Sir, R. A. Glass to become a partner, and that gentleman, in 1852, first adapted the principle of wire-covering for submarine cables, which, successfully protecting them from the perils of the deep, had its share in the development of submarine cable industry to its present enormous proportions. The story of the laying of the Atlantic cable is well known. After the failure of the cable which had been successfully laid in 1858, the Company were, from 1858 to 1864, engaged in raising new capital, and scientific men were making improvements in the form of cable and in the apparatus for submerging it. Then the Telegraph Construction and Maintenance Company was formed, with Sir John Pender as Chairman, and absorbed the firm of Glass and Elliot and the Gutta Percha Company, and an entirely new cable, much thicker and more costly than the former one, was manufactured. The 2,300 miles, weighing more than 4,000 tons, of which this cable consisted, was shipped in 1865 on board the "Great Eastern," and when over 1,000 miles had been paid out the cable snapped by overstraining, and the end sank to the bottom. A new cable was constructed with a sufficient addition of the 1865 cable to repair the disaster of that year; and in 1866 both this new cable was laid and the lost cable of 1865 recovered and completed. The firm subsequently became, and is now known as, Elliot and Co., wire-rope makers, of Great George-street, Westminster; Cardiff and Durham. Sir George Elliot fought several severe political contests, and represented South Durham in Parliament for many years, receiving his Baronetcy from Mr. Disraeli in 1874. At the time of his death he was Chairman of the Telegraph Construction and Maintenance Company and a Director of the Metropolitan Electric Supply Company.

Farmer, Moses G.—Prof. Moses G. Farmer died in Chicago on May 25th. Although but little known to the present generation of electrical workers, he was one of the most accomplished electricians of his time. Born at Boscawen, N.H., in 1820, he manifested in early life great ability as a mathematician and a strong predilection for scientific pursuits. Illness and lack of means constrained him to relinquish his studies while yet in the midst of his college course, and to seek employment as a teacher. In 1845 his attention became directed to the study of electromagnetic phenomena, and from that day to the end of his life he devoted himself with unbounded enthusiasm and unceasing diligence to the study of electrical science with reference to its industrial applications. He entered the telegraphic service in the capacity of operator and inspector in 1847, having previously invented and built an electric locomotive, and acquired some local fame as an experimental lecturer on electricity and magnetism. His first notable achievement was the construction of the municipal electric fire-alarm of Boston, which he completed in 1851. The differentiated automatic signalizing apparatus; the control of powerful mechanical forces at a distance by a feeble electric current; the constantly closed circuit, in which signals were given by interruptions; the application to such circuits of the sustaining battery; the application of the magneto-electric current machine for the production of currents of great dynamic power, and of water-power for driving the magneto machines; the protection of conductors by placing them, insulated, in wrought-iron pipes; the protection of the signal stations from the destructive effects of lightning by the "plate-arrester"—all these, and innumerable minor devices essential to the efficiency and trustworthiness of the system, had to be originated by him, for there existed at that early day no precedents by which he could have been guided. The success of the electric automatic fire alarm for the first time demonstrated that electricity, when intelligently handled, was an agency which might be depended upon as implicitly as heat or gravitation to do its appointed work. A mere catalogue of Farmer's inventions and investigations for

Digitized by Google

the next twenty years would fill pages; some of the most important of the former are the automatic repeater and the double-current system of duplex transmission, each of which now forms an indispensable part of the equipment of all the principal telegraphic systems of the world; the automatic printing telegraph; the automatic regulator for incandescent lighting systems; and, most important of all, the auto-exciting dynamo-electric machine. In this last, Siemens, Wheatstone, and Varley were independent inventors. Notwithstanding the benefits which his inventions and discoveries conferred upon the world, the story of the first fifty years of Farmer's life is one of almost incessant struggle against poverty, sickness, and discouragement. He was literally one of those men who have no time to stop to make money. In 1872 he was made professor of electrical science in the United States Naval Torpedo Station at Newport, a position most congenial to his tastes, and one in which he rendered the government most valuable service, until his increasing infirmities compelled his resignation in 1881. To Professor Farmer, perhaps, more than to any other man, may be traced the origin of the influences which have placed the United States at the head of the nations of the world in its industrial applications of electricity.

Gordon, J. E. H.—On Friday, February 3rd, whilst riding near Thornton Heath, Mr. J. E. H. Gordon's horse bolted, and, in turning a corner, threw him on to an asphalte pavement. He died an hour after his admission to the Croydon Hospital from extensive fracture of the skull. He was particularly fond of riding, and was considered an experienced and daring horseman. Although prominent latterly as an energetic contractor for the erection of electric supply stations in England and Ireland, Mr. Gordon's earlier work was perhaps the more important, and of this the building of his large dynamos was one of the most remarkable examples, judged, of course, with reference to the time, and not compared with the practice of to-day. Mr. Gordon was born in 1852, and was educated at Eton and Cambridge, with a short interval at King's College, London. He took his degree in mathematics in 1875, and studied for a year or two at the Cavendish Laboratory under Clerk Maxwell. He afterwards set up a laboratory at Pixholme, near Dorking, at the house of his father. Here he conducted researches which were the development of his work at Cambridge, and which were published in the *Philosophical Transactions* of the Royal Society in 1877 and 1879. Amongst these was an investigation of the electromagnetic rotation of polarised light carried out under Clerk Maxwell's direction. At the Dublin meeting of the British Association he gave an account of his investigation of sparking distances in air at different pressures. An elaborate research on the specific inductive capacity of solid and liquid dielectrics was published in *Phil. Trans.*, 1879. In 1880 he published "A Physical Treatise on Electricity and Magnetism," a work which is now in its third edition, and which has been published also in America and France. This book contains excellent accounts of the works of Boltzmann and others on specific inductive capacity, of terrestrial magnetism and the instruments used for measuring it, of the B.A. determination of the ohm in 1863, Prof. Adams's work on equipotential lines and lines of flow, and the researches of Spottiswoode, Moulton, and De la Rue on discharges in vacua. In 1879 and 1880 he was busily employed in experimenting on a platinum-iridium lamp. In 1881 he was appointed one of the thirty-one English delegates to the Electrical Exhibition in Paris, and in the following year he built his first large alternate-current dynamo at the Greenwich works of the Telegraph Construction and Maintenance Company. It was undoubtedly before its time, and cannot be said to have been a success, but it is of interest as being the first example of a large slow-speed dynamo. The 32 field-magnets were mounted on a rotating wheel, 8ft. 9in. in diameter, and the stationary armature coils were coupled for any desired voltage; transformers were not in existence at that time. In 1884 he published his "Practical Treatise on Electric Lighting," in which a good account of the early manufacture of glow-lamps is given. Nothing further besides a few experiments was done with his dynamo, which was protected

Digitized by Google

by two patents, until 1884, when he designed the then largest central station for lighting Paddington station, offices, hotel, &c. The three dynamos, each weighing 45 tons, and having magnet wheels 9ft. 8in. in diameter, while not large compared with modern machines (the two large Ferranti dynamos at Deptford having armatures 13ft. in diameter), attracted great attention at the time, as, indeed, did the many ingenious devices which were employed at this station. The Paddington plant was started on April 21, 1886. The Whitehall station becoming the nucleus of the present Metropolitan Electric Supply Company, Mr. Gordon became associated with the design of several new stations. About a year later, in the autumn of 1889, he severed part of his connection with the Metropolitan Company and commenced business as a consulting engineer; his restless activity found ample scope in the tempting occupation of erecting complete central stations and distributing systems at Carlow, Larne, Bray, Sydenham, and Windsor, and his sad death occurred just at the time when, owing to the large expenditure of capital involved in such work, his business was embarrassed; and his career was cut short just when his energies were needed to pull through the difficulties which surrounded it.

Glover, Walter T.—The death of Mr. Walter T. Glover, of the well-known firm of Walter T. Glover and Co., electrical wire makers, Salford, took place in May. Mr. Glover had been out of health for several years. He was one of the few men who had the boldness to think and to say that the much-abused Electric Lighting Act of 1882 did more good than harm, inasmuch as it prevented the perpetration of a lot of crude electrical engineering. Mr. Glover was one of the first to realise the necessity for accurate tables of the resistance and weight of electrical conductors; and his tables practically held the field until the introduction of the standard wire gauge.

Hertz, Heinrich.—The death of Dr. Heinrich Hertz took place at Bonn on January 1, 1894, after a long illness. A sketch of the career of this distinguished *savant*, who was only 37 years of age, will be found on p. xliv. of the Biographical Division, at the end of this book.

Hipp, M.—On the 3rd of May there passed away, in the person of Dr. M. Hipp, a telegraph pioneer of the first rank. Dr. Hipp was born on the 28th of October, 1813, at Blaubeuren in Wurtemberg, and after a short schooling was apprenticed to a watchmaker. In 1842 he settled down at Reutlingen, and busied himself with the making of watches and instruments of precision. Electric telegraphy, however, had a great attraction for him, and, thanks to his mechanical talent, he succeeded in 1845 in constructing what was then considered an epoch-making printing telegraph; the principle of which he subsequently applied to his chronoscope chronograph and electro-chemical telegraph. The limit of his printing telegraph was 130 letters a minute, and it never came into general use, chiefly because the inventor had not the means of pushing it. In the early fifties, Dr. Hipp went to Austria at the instance of Steinheil, but the proposed appointment to the Austrian Telegraph Service fell through, it being discovered that Dr. Hipp was a member of the Reutlingen Democratic Club. In 1852, owing to Steinheil's influence, Dr. Hipp was given the appointment of superintending the erection of the Swiss Telegraphs. After the lines had been completed, and got into working order, Dr. Hipp undertook the management of the Federal Telegraph Factory, which in a short time was provided with all the necessary machines for turning out telegraph apparatus in the best style. These works soon produced more than Switzerland could absorb, and the surplus was sold to Germany, France, and Italy. In 1855 the manager of the Swiss Federal Telegraph Factory obtained the Gold Medal at the Paris Exhibition, this recognition of his labours being given him specially by Napoleon III. on account of a very handy telegraph apparatus. In this year also the Hipp relay was brought out. It was devised with a view to supply the needs

Digitized by Google

of the Swiss Telegraph Service, but Steinheil, with characteristic modesty and disinterestedness, recognising its superiority, succeeded in making it widely known. About the same time also, Dr. Hipp brought out his so-called "Ratchet Wheel" printer, the idea of which was to render relays and local batteries unnecessary with Morse instruments. A very delicate electromagnet brought the printing lever alternately in contact with two small, sharp-toothed rapidly-rotating wheels, the power necessary for making an impression being derived from the clockwork of the apparatus. This ingenious, though delicate, apparatus never enjoyed much favour, and by 1863 it had entirely disappeared from the State telegraphs, although still used up to 1876 on the West Swiss Railways. In addition to managing the telegraph works, Dr. Hipp was ceaselessly busied with all manner of electrical devices, and with experiments on the induced "make and break" currents. In spite of the external prosperity of the Telegraph Factory, however, several difficulties arose, and finally, in 1860, the works were completely separated from the State, Dr. Hipp then founding a telegraph factory in Neuenburg. Soon after this, Dr. Hipp began to devote his attention to the daily increasing important branch of railway telegraphs, and in 1862 erected an electric signalling apparatus at the Winterthur Railway Station. After having spent several years on this branch of electric construction, Dr. Hipp turned his attention to electric clocks. Much of the valuable work that Dr. Hipp did in this and other directions has not been credited to him, owing to the fact that he wrote but few memoirs, most of which were buried in the *Proceedings of the Philosophical Societies of Bern and Neuenburg*. Telephony also owes to Dr. Hipp many noteworthy improvements, amongst which may be mentioned the Granular Microphone, one of the best of the type, the great advantage of it being that it will work almost equally well under all circumstances. On this account Dr. Hipp's Microphone was specially suitable for military purposes, and has been used in connection with the St. Gotthard fortifications. In 1873, at the Vienna Exhibition, Dr. Hipp was decorated with the order of Franz-Joseph, and in 1875 he was granted by the Zürich University the degree of Doctor, *honoris causâ*. Dr. Hipp spent the last few years of his life at Zürich.

Hofstede, J. P.—The death of M. J. P. Hofstede, the head of the Department of Posts and Telegraphs at the Hague, took place in March. The deceased represented the Netherlands at the International Telegraph Conferences held in Berlin and Paris, and was a perfect master of all detail in connection with his department.

Marié-Davy, M.—The death of M. Marié-Davy took place on July 16th at Clamecy, in the Department of Nièvre. Born in the year 1816, M. Davy lived to the ripe age of 77, and, though in later years he appears to have retired from the field of active scientific research, yet in earlier years he contributed many valuable Papers to, and took a prominent part in, the proceedings of the Académie des Sciences. His principal profession was that of an astronomer. Electricians have most cause to remember Marié-Davy on account of the mercury sulphate cell which he invented. This was his principal, if not his sole, invention in the field of electricity; but it has served a useful purpose in its time, though latterly it has been replaced by the silver chloride cell, for accurate work, and by less expensive batteries for commercial purposes. The object which Marié-Davy had in the invention of this cell was the production of a high and fairly constant electromotive force.

Phillips, Samuel Elkins.—The death of Mr. Samuel Elkins Phillips, in his 80th year, took place in May. He was associated with the late Dr. Whitehouse in the early days of the first Atlantic cable project. Later he was appointed superintendent of the Benghazi Station on the line connecting Malta and Alexandria, *viâ* Tripoli and Benghazi. On returning to England he was appointed by the Government one of the superintendents who were sent out with the Persian Gulf cable, and in this capacity was in charge of the Bushire Station.

Digitized by Google

Phillips, Samuel Edmund.—The death, at the age of 45, of Mr. Samuel E. Phillips, of the well-known firm of Messrs. Johnson and Phillips, took place on July 22nd. When a boy, Mr. Phillips was brought into contact with telegraphy, his father being at that time engaged with Dr. Whitehouse in carrying out experimental work in connection with the first Atlantic cable. He subsequently accompanied his father in the first Malta and Alexandria cable expedition, after which he became a member of the staff which Colonel Stewart formed to go out with the Persian Gulf cable. At the end of three years' service he returned to England, and obtained an appointment on the electrical staff of Messrs. Latimer Clark, Forde and Co., leaving these gentlemen to become electrician to Mr. W. T. Henley, in whose service he remained for ten years. At Mr. Henley's works he was appointed manager of the cable department, and occasionally he accompanied some of the cable expeditions as the head of the electrical department. As an inventor, Mr. Phillips has given us a fluid insulator, which has been largely adopted in India, Egypt and other countries. In 1875 he joined Mr. W. Claude Johnson in partnership, and a small works was established at Charlton, near London This formed the nucleus of the present extensive range of factories. Mr. Phillips took the keenest interest in scientific matters generally, and to his good judgment and sound common sense may be attributed in a great measure the success of his undertakings.

Reckenzaun, Anthony.—Mr. A. Reckenzaun, whose name will be long remembered in connection with electric locomotion on land and water, died on Saturday, November 11th, of consumption, at the age of 43 years. Mr. Reckenzaun was born at Graz, in Austria, where he received a thorough technical education. He had early opportunities of gaining practical experience with constructive details in the ironworks of his father. Desirous of enlarging his knowledge, he came to England in 1872, and obtained employment with the then flourishing marine engineering firm of Messrs. Ravenhill and Miller, of London, where the most powerful engines for the British and various foreign navies were constructed. When Mr. Ravenhill retired the business was transferred to Messrs. Easton and Anderson, of Erith, whither Mr. Reckenzaun followed. In connection with the Erith ironworks he established evening classes for the benefit of the *employés*, and gave lectures during three years on "Machine Construction and Drawing" and "Steam." After visiting the Paris Exhibition of 1878 he resolved to devote himself to the study of electrical engineering, and attended Prof. Ayrton's lectures at Finsbury Technical College. In 1881, again, at the great Electrical Exhibition in Paris, he spent nearly every day for three months within the Palais d'Industrie in order to become thoroughly acquainted with all the systems then on exhibition. After his return from Paris he joined the Faure Accumulator Company, which he left, however, soon afterwards, and accepted the post of Engineer to the Electrical Power Storage Company. There he designed the first electric launch, "Electricity," driven by means of storage batteries, in 1882, and soon afterwards he made the electric tramcar which was exhibited on the West Metropolitan Tramway in March, 1883. In 1885 Mr. Reckenzaun started business on his own account for the purpose of building boats, cars, and electric motors for various purposes. The most noteworthy of the boats was the "Volta," which made the double voyage between Dover and Calais on September 13, 1886, also the more difficult voyage between London and Dover. Mr. Reckenzaun spent nearly a year in the United States, when he introduced his electric cars on several tramways, and where he built the "Magnet," the first electric launch in American waters. He was an ardent advocate of secondary batteries, and has contributed largely to our knowledge of the subject. For the last few years Mr. Reckenzaun practised as a consulting engineer, concerning himself with power distribution and accumulators. Mr. Reckenzaun was essentially an engineer, and in devoting himself as he did to the use of accumulators for motive power, it is a question whether he did not give them more consideration than they deserved.

Smith, Oliver.—The death of Mr. Oliver Smith took place in August. The deceased was born at Great Yarmouth in 1833, and joined the Gutta Percha Company in 1851, in which year he took a part in the manufacture of the 1851 Channel cable from Dover to Calais. In 1854 he left the Gutta Percha Company to enter the service of Messrs. Glass, Elliot and Co. at Greenwich, and from 1861 to 1864 assisted in laying cables from Malta to Alexandria, from Ireland to Wales, and from Sardinia to Sicily. He was engaged on the first Atlantic cable of 1858 on the "Agamemnon," and when the "Great Eastern" was chartered to take out the new Atlantic cable in 1865 he was in charge of the electrical department on board at Sheerness, during the shipping of the cable. He also accompanied the expedition of that year, as also those of the Atlantic cables of 1866 and 1869, as electrical assistant to his brother, the late Mr. Willoughby Smith. From this time to the end of his life Mr. Smith was in the service of the Telegraph Construction and Maintenance Company, during the greater part of which time he was engaged as electrician at Enderby's Wharf, Greenwich, although occasionally assisting in cable expeditions.

Tyndall, John.—The death of Prof. Tyndall took place on December 4th. Prof. Tyndall was one of those men to whom it was given, not so much to be himself pioneer as to diffuse into others the spirit of pioneering, not so much to investigate as to make known the investigations of others in a spirit of sympathetic enthusiasm that warmed and infected his hearers. Possessed of a fluent and impressive delivery, rising at times into real oratorical power, his lectures attained a charm of style unique and inimitable. Ease and skill in experimentation before an audience—an art only to be acquired as the result of skill practised in the laboratory—he probably learned more from Faraday than from any other, except, perhaps, Bunsen. Even in his less-convincing discourse, when he left the exposition of science for the speculations of the philosopher, his peculiar gifts of manner carried his hearers irresistibly along. Born near Carlow, in 1820, the son of a member of the Irish constabulary, he had few advantages in the way of early training beyond a sound knowledge of geometry, and a schooling that lasted until he was nearly 19. He entered the Ordnance Survey as a civil assistant in 1839, and was occupied in this work until 1843. Then, for three years, he was employed in railway surveying in various parts of England, only to find that his passion for science would not let him settle to the life of surveyor. So he accepted a post as assistant teacher at Queenwood College in Hampshire, and was by that fortunate circumstance brought into fellowship with the then rising young chemist, Edward Frankland. In 1848, these two young men repaired to Marburg to study under Bunsen, Tyndall going on later to Berlin to work under Magnus at physics. He translated Clausius's thesis on the moving force of heat, and subsequently that of Helmholtz on the conservation of force, which was pointed out to him by his friend Du Bois Reymond. Whilst in Germany he began those investigations into diamagnetism, and the relations of magnetism to crystallography, which will ever be associated with his name. It was his work on these two kindred topics that brought him first into notice. He was, on his return to England, invited to lecture at the Royal Institution, where Faraday had for twenty years been actively at work. The lecture was given in February, 1853, and in May of the same year the post of Professor of Natural Philosophy was created for him. He devoted much time during the succeeding years to research, and from magnetism passed on to the subject of the radiation of heat, upon which subject he published—mainly in the *Philosophical Transactions* of the Royal Society—a number of memoirs. The substance of these was afterwards reprinted in a separate volume. His more popular work, "Heat a Mode of Motion," was published in 1863, and was followed by the volumes of lectures "On Sound" and "On Light." This latter was the substance of his famous lectures delivered in America in 1872. On electrical subjects, beyond the diamagnetic researches, he published little, his "Notes on Electricity" being mainly historical. His other topics of research were: the motion and structure of

Digitized by Google

glaciers, the spread of dust and germs in the atmosphere, and the effect of mist and fog on sound. In his youth the disciple, and in his middle age the intimate friend, of Carlyle, he also owed much to the influence of Emerson and to that of Goethe. His lectures contain frequent references to these his masters in literature; but his style was not modelled on that of any of them. The vehemence with which at times he spoke and wrote was indeed but one result of the passionate sincerity of soul and of the restless energy that burned within him. He made the whole world his debtor by his masterly expositions of modern science.

Van Rysselberghe, F.—The death of the eminent Belgian electrician, M. Van Rysselberghe, took place in February. M. Van Rysselberghe was born at Ghent on August 25, 1846. At the time of his decease he was consulting engineer to the Telegraph Department of the Belgian Government; Professor of Electrotechnics at the University of Ghent; Chevalier of the Legion of Honour and of the Order of Leopold. Having mainly completed his education by his own exertions, M. Van Rysselberghe was, in 1865, appointed Professor of Nautical Astronomy at Ostend, where he invented the Maréeographe, for recording the rise and the fall of the tide, and the Météorographe, for registering atmospheric changes. Having acted as hydrographical engineer, charged with preparing a chart of the Scheldt, he was in 1887 attached, as meteorologist, to the Royal Observatory at Brussels, and entrusted with editing the *Bulletin* of the Observatory. It was at this period of his career that he invented his Telemétéorograph, which was awarded a gold medal at the International Electrical Exhibition of Paris in 1881. Taking part in the Congress of Electricians in the same year, he was made Chevalier of the Legion of Honour. In 1880 M. Van Rysselberghe began the experiments in simultaneous telephony and telegraphy, with which his name is identified, on the wire running between the Brussels Observatory and the Meteorological Station at Ostend. In 1884, on giving the Belgian Government free use of his invention M. Van Rysselberghe was appointed consulting engineer to the Telegraph Department of the Belgian Government, and was also made Chevalier of the Order of Leopold. Subsequently, in conjunction with M. Charles Mourlon, he was occupied in pushing his system of simultaneous telephony and telegraphy, and in devising an hydro-electric scheme for the town of Antwerp.

Weaver, Henry.—The death of Mr. H. Weaver occurred at Folkestone on Wednesday, September 20th, from heart disease. Born at Shrewsbury on May 5, 1825, Mr. Weaver entered the Electric Telegraph Company in May, 1846, and had charge of various stations in England till 1853. In connection with this Company two submarine telegraph cables were laid between Lowestoft and the Hague, and subsequently two more between Lowestoft and Zand Voort, Holland. This undertaking was managed by Mr. Weaver until 1859, when the Dutch ends of the cables were transferred to the Dutch Government. Upon his return to London, in 1859, he became metropolitan superintendent for the Electric Telegraph Company, and manager of the International Telegraph Company in London, which position he occupied till 1864, when he was appointed secretary to the Electric and International Telegraph Company, and held that position till 1870, when the telegraphs were transferred to the Government. The whole of the negotiations for the purchase by the State of the lines, cables, and business of the companies represented by him were under his control, he being appointed sole arbitrator. After the transfer of the inland telegraphs to the State, Mr. Weaver took the management of the Anglo-American Telegraph and the Atlantic Telegraph Companies, which position he held since January 1, 1870. In addition to being managing director of the Anglo-American Company, he was also director of the Indo-European Telegraph Company, director of the West India and Panama Telegraph Company, and the Western Union Telegraph Company. Mr. Weaver originated the "word" system of counting and charging messages, and introduced it on the Atlantic cables on May 1, 1872.

PATENTS, DESIGNS, AND TRADE MARKS.

THE following practical information concerning the procedure and average costs of obtaining Letters Patent for Inventions, and the Registration of Trade Marks and Designs, has been compiled for this Directory by Mr. J. C. CHAPMAN, Assoc. Mem. Inst. C.E., Mem. Inst. M.E., Fel. Chartered Inst. Patent Agents, from whom all information regarding Patents for Inventions may be obtained.

BRITISH LETTERS PATENT.

(Covering Great Britain, Ireland, and the Isle of Man.)

The Acts in force are cited collectively as the Patents, Designs, and Trade Marks Acts, 1883 to 1888. The principal Act, 1883 (46 and 47 Vict., Ch. 57), is "An Act to Amend and Consolidate the Law relating to Patents for Inventions, Registration of Designs, and of Trade Marks" (25th August, 1883).

The Amendment Act, 1885 (48 and 49 Vict., Ch. 63) deals with applications for Patents by several persons jointly; it also grants extension of time for leaving complete specifications, and provides that incompleted applications shall never be open to inspection or published.

The Amendment Act, 1886 (49 and 50 Vict., Ch. 37), modifies the regulations as to drawings, and extends protection to exhibits at foreign international exhibitions.

The Amendment Act, 1888 (51 and 52 Vict., Ch. 50), provides for a Register of Patent Agents being kept, defines duties of Comptroller in reference to examiners' reports, contains numerous amendments as to applications, oppositions, and other matters, and defines the essential particulars of a Trade Mark.

GENERAL.

The British Patent right covers the United Kingdom of Great Britain, Ireland, and the Isle of Man.

Every Patent is granted for 14 years, and is numbered and dated as of the day of application. This term may be prolonged by order of the Privy Council under certain conditions appearing in evidence.

The duty paid on application with the complete specification covers the first term of 4 years.

The remaining 10 years may be covered by annual fees, viz. :—

Before the expiration of the 4th year from the date of the Patent in respect of the 5th year, £5, and so on, increasing £1 annually up to £14 in respect of the 14th year, at the expiration of which the Patent lapses. Or the Patentee may pay the whole or any portion of the aggregate of such prescribed annual fees in advance.

The dates of payment may at the Comptroller's discretion be extended for 1, 2, or 3 months on payment of fees of £1, £3, and £5 respectively. No further extension can be allowed beyond three months.

Letters Patent are granted (1) to the true and first inventor or inventors; (2) to the first importer or importers, or their agent; or (3) to several persons jointly, one or more of whom is or are the first inventor or inventors.

Thus, a financier or a company can obtain security at once by joining an inventor in the application.

For a valid Patent the subject-matter must be referable to some *manner of manufacture*, and must, in addition, be new and useful, and display some amount

Digitized by Google

of invention. It is advisable for an applicant to have a search made as to novelty before settling his complete specification and claims.

No official search is made, and the grant of a Patent does not guarantee its validity. Searches as to novelty, title, or record may be made in the records of the Patent Office, where all specifications of prior Patents and indexes ("Alphabetical" and "Subject Matter"), supplemented by abridgments of specifications, are kept. A Patent holds good against the Crown. No working conditions exist, nor is importation forbidden.

A Register of Patents is kept, and therein the names and addresses of patentees, registered assignments, and transmissions (under agreement or otherwise), licences, amendments, extensions, and revocations, and all other matter affecting the validity or the proprietorship of Patents, are recorded.

Compulsory licences may be ordered to be granted by the Board of Trade if default be made by the patentee to grant licences on reasonable terms, or the reasonable requirements of the public cannot be supplied, or any person is prevented from working or using to the best advantage an invention of which he is possessed.

PENALTIES.

The following is the complete text of Sections 105 and 106 of the Patents, Designs, and Trade Marks Act, 1883.

105. (1) Any person who represents that any article sold by him is a patented article when no Patent has been granted for the same, or describes any design or trade mark applied to any article sold by him as registered which is not so, shall be liable for every offence on summary conviction to a fine not exceeding five pounds.

(2) A person shall be deemed, for the purposes of this enactment, to represent that an article is patented or a design or a Trade Mark is registered, if he sells the article with the word "Patent," "Patented," "Registered," or any word or words expressing or implying that a Patent or Registration has been obtained for the article stamped, engraved, or impressed on, or otherwise applied to, the article.

106. Any person who, without the authority of Her Majesty, or any of the Royal Family, or of any Government Department, assumes or uses in connection with any trade, business, calling, or profession, the Royal arms, or arms so nearly resembling the same as to be calculated to deceive, in such a manner as to be calculated to lead other persons to believe that he is carrying on his trade, business, calling, or profession by or under such authority as aforesaid, shall be liable on summary conviction to a fine not exceeding twenty pounds.

PROCEDURE.

A Patent may be applied for in two ways :—

(1) By application with PROVISIONAL SPECIFICATION. This must state the nature of the invention, and secures protection for 9 months (extensible to 10), before the expiry of which a Complete Specification must be filed. This will carry on the Patent for 14 years from date of application, subject to the above periodic payments.

(2) By application with COMPLETE SPECIFICATION, in the first instance, which secures protection for 14 years, subject to the above annual payments.

In either case immediate protection is obtained, and the invention may be published or exercised before the actual grant, at the applicant's risk; no true protection is acquired by provisional protection except as regards priority of date, for no action for infringement can be entered before the Patent is granted.

The application must be in accordance with the prescribed rules, and be accompanied by a declaration and petition. The authorisation of a respectable Patent agent to deal with all matters affecting the Patent is very advisable, as much time is thus saved.

Digitized by Google

The 9 or 10 months secured by provisional protection enables an inventor to experiment and develop his invention, and also to apply for foreign Patents before completing his home Patent.

The provisional specification is the foundation of a Patent, and should therefore be most skilfully drawn, as the subsequent complete specification and Patent are controlled by it, no additions being valid which extend the scope of the invention described in the Provisional.

The complete specification, whether left on application or subsequently, must particularly describe and ascertain the nature of the invention, and in what manner it is to be carried into useful effect, and be accompanied by drawings if required. The description must be such as to enable any person of ordinary skill in the art to produce the same result from the directions contained in the specification and drawings. No Patent can cover more than one invention, though modifications and subordinate claims are allowed. The specification must conclude with a distinct statement of what is claimed as the invention.

The claims are most important; on them the whole value of the Patent depends.

If too much be claimed the whole is invalidated until amended; if too little, it may be valueless.

For these reasons it is most indiscreet, especially in the case of a valuable invention, for anyone to attempt to settle claims who is not well acquainted with the laws and most recent judicial decisions in connection with the subject, and the employment of a competent Patent agent is again advised.

Every application is referred to an official examiner, who reports to the Comptroller.

The examiner's report is private.

In case of an adverse report the Comptroller may, after hearing the applicant or his agent, require the papers to be amended.

The applicant may appeal from the Comptroller's decision to the Law Officer, whose decision is final.

If a complete specification is not filed within 10 months of the provisional date the application will be deemed to be abandoned, and if so abandoned is never published.

Specifications, whether provisional or complete, if in proper form and not requiring amendment, may be accepted in from 4 to 6 weeks from date of filing.

Unless a complete specification is accepted within 12 months from the date of application, then at the expiration of such 12 months (save in the case of an appeal having been lodged against the Comptroller's refusal to accept), the application shall become void. In case of such appeal the 12 months may be extended to 15 months.

When a Complete Specification has been accepted, it is advertised as such, and any person can examine it at the Patent Office on payment of a fee.

During the 2 months following the date of the advertisement of the acceptance of a complete specification, any person can oppose it on the following grounds:—

(1) That the applicant obtained the invention fraudulently.

(2) That the invention has been patented in this country on an application of prior date.

(3) That applicant's complete specification describes or claims an invention other than that described in the provisional specification, and that such other invention forms the subject of an application made by the opponent in the interval between the leaving of the provisional specification and the leaving of the complete specification; but on no other grounds.

If it is unopposed, or if opposition be decided in favour of the applicant, the Patent is sealed at the expiration of the 2 months.

Digitized by Google

In cases of opposition, statutory declarations may be filed by both sides, and the case is heard and decided by the Comptroller.

Either side can appeal from his decision to the Law Officer, whose fiat is final.

A Patent may be revoked on certain grounds.

The specification, with drawings (if any), is officially printed and published 21 days after acceptance of complete specification. The cost of all officially printed specifications is 8d. each.

The following are fair average charges for obtaining Letters Patent:—

PROVISIONAL PROTECTION.

Instructions for application with provisional specification, drawing title, declaration, and provisional specification, and preparing fair copies, paid fee on application, £1; obtaining provisional protection, agency, letters, postages from £3 3s. to £5 5s.

COMPLETE SPECIFICATION AND PATENT.

Instructions for complete specification, drawing same, and settling claims and preparing fair copies of same; paid stamp duty, £3; obtaining allowance of specification and Letters Patent, agency, letters, postages from £8 8s. to £10 10s.

WHEN COMPLETE SPECIFICATION IS LODGED IN FIRST INSTANCE.

Taking instructions for complete specification, drawing title and declaration and complete specification, and settling claims and preparing fair copies of same; paid stamp duty, £4; obtaining allowance of specification and Letters Patent; agency, letters, postages from £10 10s. to £12 12s.

Drawings may in some cases be included, but are usually charged for extra, according to the requirements of the invention, and the draughtsmen's time.

The above are the costs of obtaining an unopposed Patent for four years, and apply to all average cases.

In cases of appeal or opposition extra costs will arise, of which an approximate estimate can usually be given.

It is an essential requisite for a valid Patent that a full disclosure of the whole invention, and the best means of practically performing or effecting it within the inventor's knowledge, be set forth. Any ambiguity, omission, or concealment of essential features will invalidate the Patent.

COLONIAL AND FOREIGN PATENTS.

The order or sequence in which colonial and foreign Patents should be applied for, especially when a British application has been made, is most important, because the term of grant varies in most countries, and it is desirable to obtain the longest term for any Patent; and because in all foreign countries (except Germany and Mexico) Patent rights expire at the same time as prior Patents of the shortest terms granted obtained in other countries for the same invention.

By the International Convention, of which Belgium, Brazil, Curaçoa and Surinam, France, Great Britain, Guatemala, Italy, Netherlands, East Indian Colonies of the Netherlands, Norway, Portugal, San Domingo, Servia, Spain, Sweden, Switzerland, Tunis, United States of America, constitute a Union, the following provision is made by Article IV.:

"Any person who has duly applied for a Patent, Industrial Design or Model, or Trade Mark, in one of the contracting States, shall enjoy, as regards registration in the other States, and reserving the rights of third parties, a right of priority during the periods hereinafter stated. Consequently, subsequent registration in any of the other States of the Union before the expiry of these periods shall not be invalidated through any acts accomplished in the interval, either, for instance, by another registration, by publication of the Invention, or by the working of it by a third party, by the sale of copies of the Design or Model, or by the use of the Trade Mark.

"The above-mentioned terms of priority shall be six months for Patents, and three months for Industrial Designs and Models and Trade Marks.

"A month longer is allowed for countries beyond sea."

Digitized by Google

The 9 or 10 months secured by provisional protection enables an inventor to experiment and develop his invention, and also to apply for foreign Patents before completing his home Patent.

The provisional specification is the foundation of a Patent, and should therefore be most skilfully drawn, as the subsequent complete specification and Patent are controlled by it, no additions being valid which extend the scope of the invention described in the Provisional.

The complete specification, whether left on application or subsequently, must particularly describe and ascertain the nature of the invention, and in what manner it is to be carried into useful effect, and be accompanied by drawings if required. The description must be such as to enable any person of ordinary skill in the art to produce the same result from the directions contained in the specification and drawings. No Patent can cover more than one invention, though modifications and subordinate claims are allowed. The specification must conclude with a distinct statement of what is claimed as the invention.

The claims are most important; on them the whole value of the Patent depends.

If too much be claimed the whole is invalidated until amended; if too little, it may be valueless.

For these reasons it is most indiscreet, especially in the case of a valuable invention, for anyone to attempt to settle claims who is not well acquainted with the laws and most recent judicial decisions in connection with the subject, and the employment of a competent Patent agent is again advised.

Every application is referred to an official examiner, who reports to the Comptroller.

The examiner's report is private.

In case of an adverse report the Comptroller may, after hearing the applicant or his agent, require the papers to be amended.

The applicant may appeal from the Comptroller's decision to the Law Officer, whose decision is final.

If a complete specification is not filed within 10 months of the provisional date the application will be deemed to be abandoned, and if so abandoned is never published.

Specifications, whether provisional or complete, if in proper form and not requiring amendment, may be accepted in from 4 to 6 weeks from date of filing.

Unless a complete specification is accepted within 12 months from the date of application, then at the expiration of such 12 months (save in the case of an appeal having been lodged against the Comptroller's refusal to accept), the application shall become void. In case of such appeal the 12 months may be extended to 15 months.

When a Complete Specification has been accepted, it is advertised as such, and any person can examine it at the Patent Office on payment of a fee.

During the 2 months following the date of the advertisement of the acceptance of a complete specification, any person can oppose it on the following grounds:—

(1) That the applicant obtained the invention fraudulently.

(2) That the invention has been patented in this country on an application of prior date.

(3) That applicant's complete specification describes or claims an invention other than that described in the provisional specification, and that such other invention forms the subject of an application made by the opponent in the interval between the leaving of the provisional specification and the leaving of the complete specification; but on no other grounds.

If it is unopposed, or if opposition be decided in favour of the applicant, the Patent is sealed at the expiration of the 2 months.

FOREIGN AND COLONIAL PATENTS FOR INVENTIONS.

Countries.	Term of Grant.	How Maintained.	Patents must be worked as follows :—	Approximate Average Cost.	Term Covered by Quotation.
Argentine Republic ..	5, 10, 15 years ...	Fees on application	Within 2 years of date of issue	£40, £50, £80 ...	5, 10, 15 years.
¶ Austria (alone) ...	15 years	Annual tax	Within 1 year from date of grant; working not to be interrupted for 2 years at a time.	£10	1 year.
¶ Austria-Hungary .. (combined)	15 years	Annual tax, increasing after first 5 years.		£11 to £15	1 year.
¶*Belgium	20 years	Annual increasing tax ...	1 year from first working elsewhere; if applied for after working elsewhere, 1 year from date of patent.	£6 to £9	1 year.
¶*Brazil	15 years	Ditto	3 years from date of patent; not to be interrupted more than 1 year at a time.	£40 to £50	1 year.
¶ Canada	15 years	Full fees on application, or by taxes before end of 5th and 10th years.	2 years from date of patent, and working not to be discontinued.	£14 to £20	5 years.
¶ Cape of Good Hope	14 years	By taxes before end of 3rd and 7th years.	No conditions	£25 to £30	3 years.
Ceylon	14 years	By payment of all fees on application or before end of 4th year and *then annually.*	No conditions	£25 to £30	14 years.
Chili	Fixed by Government.	None	Ditto	£100.	
¶ Denmark	From 3 to 15 years. Term fixed by Government.	Fees on application	1 year from date; not to be interrupted more than 1 year at a time.	£9 to £16	Full term granted.
¶*France	15 years	Annual tax	2 years from date of issue; not to be interrupted 2 years at a time.	£10 to £15	1 year.
Germany	15 years	Annual increasing tax, 3 months' grace allowed.	3 years from publication of grant...	£12 to £20	1 year.
Do. "Utility Model"	3 to 6 years	Fee end of 3rd year	No conditions	£4 and £8	3 and 6 years.
*Great Britain	14 years	*See* pp. 77-80	None. *See* pp. 77-80.....	.....	*See* pp. 77-80

Countries.	Term of Grant.	How Maintained.	Patents must be worked as follows :—	Approximate Average Cost.	Term Covered by Quotation.
Hong Kong	Term fixed by Governor, same as English patent.	Fees on application	None	£30 to £40	
¶ Hungary (alone)	15 years	Annual taxes	1 year from grant	£10	1 year.
¶ India	14 years	Tax to be paid before expiration of 4th and each succeeding year.	None	£18 to £25	4 years.
¶*Italy	Any term not exceeding 15 years.	A proportional and annual tax increasing triennially.	Under 6 years' patent, 1 year from date of grant; over 6 years, 2 years from date of grant; not to be interrupted more than 2 years at a time.	£12 to £15 (incl. proportional tax) £18 to £20 do. £21 to £25 do.	1 year. 6 years 15 years.
Japan (New Law 1888)	5, 10, and 15 years	Fees on application for term.	Within 3 years, not to be discontinued for any consecutive 3 years.	£20 £6 to £12	5 years. 1 year.
Luxembourg	15 years	Annual and progressive tax.	May be revoked unless worked within 3 years from date of patent	£50 to £60.	
Mexico	20 years	Fees on application	Within 5 years from date of patent	£25 to £30.	
¶ Natal	14 years	Stamp duties before end of 3rd and 7th years from date.	No conditions		
New South Wales	14 years	Fees on application	None	£15 to £20	14 years.
¶ New Zealand	14 years	Tax before end of 5th year	Within 2 years from date	£15 to £20	5 years.
¶ Newfoundland	14 years	Fees on application	Ditto	£35 to £40	14 years.
*Norway	15 years	Annual progressive tax ... [and 7th years.	3 years from date; not to be interrupted for more than 1 year.	£10 to £15	1 year.
¶ Orange Free State	14 years	Tax before expiry of 3rd	Compulsory licenses can be enforced	£35 to £45	3 years.
¶*Portugal	Any term not exceeding 15 years.	Fees on application	2 years from date; not to cease working 2 years subsequently.	£30 to £50	Term granted.
Queensland	14 years	Taxes before 4th and 8th years, or by annual payments from 4th year.	No conditions	£15 to £20	4 years.
¶ Russia	3, 5, or 10 years...	Fees on application	Within a quarter of the term granted.	£30 £50 £80	3 years. 5 years. 10 years.

FOREIGN AND COLONIAL PATENTS FOR INVENTIONS—(*Continued*).

Countries.	Term of Grant.	How Maintained.	Patents must be worked as follows :—	Approximate Average Cost.	Term Covered by Quotation.
¶ South Australia ...	14 years	Taxes before 3rd and 7th years.	Patent may be revoked if not worked within 3 years from date of patent.	£16 to £21	3 years.
¶*Spain	10 years, if a foreign patent has been applied for previously; if not so, 20 years.	Annual increasing tax ...	2 years from date; not to be interrupted for more than 1 year and 1 day.	£14 to £18	1 year.
¶ Straits Settlements	14 years	Fees on application	None	£25 to £35	14 years.
¶ Sweden	15 years	Annual tax increasing every 5 years, payable in advance.	3 years from date of patent; not to be interrupted more than 1 year at a time.	£12 to £16	1 year.
*Switzerland.....	15 years	Annual increasing tax ...	3 years from date of application ...	£10 to £12	1 year.
¶ Tasmania.....	14 years	Stamp duties before end of 3rd and 7th years.	Compulsory licenses can be enforced	£16 to £20	3 years.
¶*Transvaal	14 years	Tax before expiry of 3rd and 7th years.	Compulsory licenses can be enforced	£35 to £45	3 years.
¶ Turkey	5, 10, or 15 years	Annual tax	2 years from date of issue; not to be interrupted more than 2 consecutive years.	£25	1 year
¶*U.S. America	17 years	Fees on application	None	£18 to £26	17 years.
¶ Victoria	14 years	Stamp duties before end of 3rd and 7th years.	None	£15 to £20	3 years.
¶ Western Australia	14 years	Fees on application for Letters of Registration tax before end of 4th and 7th year for letters' patent.	None	Letters of Registration, £25 to £35.	Term granted.
				Patent, £25	4 years.

* These countries are members of the International Convention.
¶ The Term of Grant in these countries is subject to that of existing foreign patents.

REGISTRATION OF DESIGNS.

Copyright of a design may be granted to or on behalf of anyone claiming to be the proprietor of a new or original design not previously published in the United Kingdom, whether it be applicable for the pattern, shape, or configuration or ornament of any article of manufacture (except sculpture, which is specially provided for by the Sculpture Copyright Act of 1814).

Copyright in designs does not cover any motions or mechanical arrangements, as is generally supposed. It is important to remember that the *design* is for the shape, pattern, or configuration, and is quite *extrinsic* to the article of manufacture.

The duration of copyright is five years from date of registration.

An application must state the nature of the design and the class or classes of goods for which it is to be registered. The protection afforded to a registered design is restricted to the particular class or classes of goods in which the design is registered. The same design may be registered in more than one class.

Copyright of designs can be assigned.

Under certain conditions immediate registration can be secured.

A design is not open to public inspection during the term of its copyright.

An official search is always made on each application.

Prior to application an official search may be made by the Comptroller on request, who will report on the identity or similarity of proposed design to prior registrations.

All registered designs must be so marked in accordance with Rule 32 otherwise copyright is nullified.

The average charges for application and registration, inclusive of fees, &c., are :—

In classes 1 to 12, £2 2s. for the first, and £1 11s. 6d. for each subsequent application.

In classes 13 and 14, 10s. to 15s. for the first, and 7s. to 10s. for each subsequent application.

For search and report by Comptroller, under Section 53, £1 1s.

Owing to the intricacies of procedure, it is in all cases advisable to employ an experienced agent.

REGISTRATION OF TRADE MARKS.

(BRITISH.)

The rules, regulations, conditions, restrictions, &c., in connection with this department are stringent and complicated ; great care and experience are required in complying with them.

Old Marks are those used before August 13, 1875.

New Marks are those adopted since that date.

(1) A new Mark must consist of or contain at least one of the following essentials :—

(*a*) A name of an individual or firm printed, impressed, or woven in some particular and distinctive manner ; or

(*b*) A written signature or copy of a written signature of the individual or firm applying for registration thereof as a Trade Mark ; or

(*c*) A distinctive device, mark, brand, heading, label, or ticket ; or

(*d*) An invented word or invented words ; or

(*e*) A word or words having no reference to the character or quality of the goods, and not being a geographical name.

Digitized by Google

(2) There may be added to any one or more of the essential particulars mentioned in this section any letters, words, or figures, or combination of letters, words or figures, or of any of them, but the applicant for registration of any such additional matter must state in his application the essential particulars of the Trade Mark, and must disclaim in his application any right to the exclusive use of the added matter, and a copy of the statement and disclaimer shall be entered on the register.

(3) Provided as follows:—

(i.) A person need not under this section disclaim his own name or the foreign equivalent thereof, or his place of business, but no entry of any such name shall affect the right of any owner of the same name to use that name or the foreign equivalent thereof;

(ii.) Any special and distinctive word or words, letter, figure, or combination of letters or figures, or of letters and figures used as a Trade Mark before the 13th day of August, 1875, may be registered as a Trade Mark under this part of this Act.

RESTRICTIONS ON REGISTRATION.

Ornamental or coloured groundwork, such as tartans or checks, cannot be claimed as part of a Mark unless such groundwork be included within the Mark by some border or lines.

The words "Registered," "Registered Design," "Copyright," "Entered at Stationers' Hall," "To counterfeit this is Forgery," will not be registered under the Acts, and should not, therefore, appear upon the Representations of Trade Marks forming part of an application.

The following will not be registered as Trade Marks, or as prominent parts of Trade Marks, unless the Marks have been used before 13th August, 1875:—

The Royal Arms, or arms so nearly resembling them as to be calculated to deceive.

Representations of Her Majesty the Queen, or of any member of the Royal Family.

Representations of the Royal Crown.

The National Arms or Flags of Great Britain.

Proper names.

Names in the possessive case associated with the goods.

When there appears on the face of a Trade Mark an indication of the goods to which the Mark is applied, the claim for its registration must be in respect of *those goods only.*

All new Marks must include one or more of the above essential particulars.

Trade Marks are granted to any person or firm.

A series of Marks can be registered under certain conditions.

An official search is made of a rigorous description in connection with formal applications only.

The term acquired by Registration is unlimited, subject only to a small pay ment before the end of the 14th, and each succeeding 14th year.

Registration covers the United Kingdom, Ireland, and the Isle of Man.

A Trade Mark may be assigned.

The charges are usually from £2 2s. upon application for registration, and £1 1s. on acceptance of the Mark, or £3 3s. to £4 4s. for complete registration.

For registration of a series of Marks special charges for specific cases are made.

For a search the charge varies from 10s. 6d. to £1 1s. for each class searched.

A wood block or electro must be furnished not more than two inches in depth or width, otherwise a small extra charge is incurred.

Owing to the great difficulty at present of obtaining registration of Trade Marks, the advice of an experienced agent on specific cases is advisable. In any case the procedure is tedious and troublesome, and after acceptance a Mark is advertised

Digitized by Google

in the official *Trade Marks Journal*, during the first month of which (extensible to three months at the Comptroller's discretion) it may be opposed. The procedure is then analogous to that of Patent cases as above set forth.

PATENT AGENTS.

The Chartered Institute of Patent Agents was founded in 1882, and incorporated by Royal Charter, August 11th, 1891, and its offices are at 19, Southampton Buildings, W.C. A list of its Fellows will be found on a subsequent page; each Fellow is entitled to call himself "Chartered Patent Agent," or add after his name the letters "C.P.A." A Register of Patent Agents has been inaugurated in accordance with the Act of 1888; but it is to be understood that a "registered Patent Agent" is not by any means necessarily a "*Chartered Patent Agent*"—the rules for qualification of the latter being very strict.

MERCHANDISE MARKS ACT, 1887.

50 & 51 Vict., ch. 28.

This Act should be carefully considered by all persons who are in any way connected with manufactures or commerce.

The Act repeals the Act of 1862, and its object is to consolidate and amend the law relating to the fraudulent marking of merchandise, and to prevent the improper introduction in the United Kingdom of goods manufactured abroad. Trade descriptions as well as trade marks are also included within its scope.

Attention is called to the fact that the new Act is a Penal Act, and that every person guilty of an offence against it (sec. 2, sub-sec. 3) is liable to imprisonment, with or without hard labour, for a term not exceeding 2 years, or to a fine, or to both imprisonment and fine, and to forfeit every article by which such offence has been committed.

No prosecution for any offence can be commenced after the expiry of 3 years from the commission of such offence, or 1 year after the discovery thereof by the prosecutor, whichever expiration first happens (sec. 15).

PATENTS, DESIGNS, & TRADE MARKS ACTS,

1883 to 1888.

MERCHANDISE MARKS ACT, 1887.

Advice (based on many years' practical experience) given under the above.

Letters Patent for Inventions secured, and Trade Marks, Labels, and Designs registered at home and abroad.

Specifications for Patents and Trade Marks drawn or revised and settled.

Applications for Patents taken up after the grant of Provisional Protection, or at any stage.

Oppositions to the grant of Letters Patent conducted or defended.

Scientific evidence and cases prepared for submission to Counsel.

Amendments and Alterations prepared and executed.

Advice as to Assignments of and Licenses for the use of Inventions.

Reports and opinions given on all Mechanical Subjects, and on Patent Law.

Searches made as to previous Patents and Trade Marks; Opinions and Reports thereon.

Illustrative Diagrams. Tracings prepared. **Trade Marks designed.** The necessary Drawings prepared to accompany all applications for Registration.

Manufacturers and Traders advised on all matters affecting the Registration of Trade Marks or Designs and the Merchandise Marks Acts.

Expert evidence given in Patent or Mechanical cases.

Experienced and reliable Agents in all countries where Patent Laws exist.

No charge for preliminary information to a reasonable extent. Full information as to Procedure Terms, &c., on application to—

J. C. CHAPMAN,

(Assoc. M. Inst. C.E., M. Inst. M.E., Fellow of the Chartered Institute of Patent Agents,)

This "Digest" is specially prepared for "The Electrician" Electrical Trades' Directory and Handbook, is revised to date, and is copyright.
The "Digest" is published separately, price 2/6 (with additional matter).

DIGEST OF THE LAW OF ELECTRIC LIGHTING.

By A. C. CURTIS HAYWARD, B.A., Solicitor, Associate of the Institution of Electrical Engineers.

Introductory.

ELECTRIC Lighting is governed by two Acts of Parliament known as the Electric Lighting Acts,* 1882 and 1888, which apply to the whole United Kingdom. The former incorporates portions of the Gasworks Clauses Acts, 1847 and 1871, the Lands Clauses Acts, 1845, 1860, and 1869, and the Telegraph Act, 1878. The Electric Lighting (Scotland) Act, 1890,† merely amends the Act of 1882, as regards the definition of Local Authorities in Scotland.

The other documents to be referred to all emanate from the Board of Trade. These are (1) the Rules made under (1882) § 5,‡ with respect to applications for Licenses and Provisional Orders, &c., as amended in August, 1890; (2) the Regulations made under (1884) § 4, for the protection of public safety and of the lines and works of the Postmaster-General, and of other electric lines and works; (3) the Model Form for Provisional Orders; (4) the Regulations issued under each Provisional Order for securing the safety of the public, and for ensuring a proper and sufficient supply of electrical energy.

The Model Order fills in details to the outline sketched by the Acts, and as the Board of Trade require its provisions to be inserted in all Provisional Orders and Licenses, it must be treated for practical purposes as a part of the General Law of Electric Lighting. This Model Order has undergone various changes since its first issue, and now exists in four forms, viz.: No. 1, applicable to an undertaking by a Local Authority; No. 2, by a Company or person; and Nos. 3 and 4, special forms applicable to undertakings by Companies and Local Authorities respectively within the County of London.‖ There is also a Model Eorm for Licenses. The Model Order which will be usually quoted is the No. 2 Form issued for the Session 1892 as applicable to "Undertakers being a Company or person," and the chief points in which it differs from the companion Form No. 1, relating to "Undertakers being a Local Authority," will be recorded either where they occur, or in Part II., Chapter V. A.

The Law will here be dealt with in two parts:—

I. Preliminary. Treating of the manner in which persons desirous of supplying electricity must set to work.

II. Treating of their rights and obligations after obtaining Parliamentary powers.

* 45 & 46 Vict., cap. 56, and 51 & 52 Vict., cap. 12.

† 53 & 54 Vict., cap. 13.

‡ **References.**—The Electric Lighting Acts of 1882 and of 1888 are respectively indicated thus: (1882) and (1888); a figure immediately following indicates the section of the Act referred to. References such as (Rule 1), &c., refer to the Board of Trade Rules of 1890, while (Clause 1), &c. refer to Clauses of the Model Order, No. 2 form, unless otherwise stated.

‖ This has not been applied to the City, for which the three Orders hitherto granted contain certain special peculiarities, notably in the clauses relating to transfer and purchase of the undertaking, the method of keeping accounts, and reduction of prices for supply on a sliding scale.

PART I.

PRELIMINARIES TO UNDERTAKING THE SUPPLY OF ELECTRICITY.

CHAPTER I.

Supply Outside the Acts.

Before proceeding to deal with those who supply electricity under Parliamentary powers, called by the Acts "Undertakers," mention should be made of the position of persons who may supply electricity without obtaining such powers.

Previously to the Electric Lighting Acts such persons might place their conductors wherever they could get leave to do so; though for breaking up streets, &c., even with consent of the Local Authority, they were liable to indictment for causing a nuisance. It was held, however, that Local Authorities have no more power of interfering with overhead wires crossing the streets than is possessed by ordinary members of the public * (*see* Wandsworth Board of Works *v.* United Telephone Company, Limited, 13 Q.B.D., 904). On the other hand, it must be borne in mind that private individuals could always prevent wires passing over their property, even though not attached to anything upon it.

The Act of 1882 had no effect upon this state of things, but (1888) § 4 rendered all electric lines, or other work laid down or erected in, over, along, across, or under any street, for the purpose of supplying electricity, liable to Regulations of the Board of Trade for the protection of public safety and of telegraph works. The Regulations † issued by the Board of Trade under this Section provide that the height of an aerial conductor must not be less than 20ft., or 30ft. where crossing a street, nor be within 6ft.‡ of any building, except when brought in for purposes of supply, and the angle of crossing a street must not be less than 60deg. The spans must not exceed 200ft., or 150ft. if the direction is curved or dips. They prescribe the factors of safety for wires, supports, &c., efficient earth connections for metal supports and coverings, lightning conductors and protectors, precautions against contact with other wires, the maximum working current, and also specify for insulation, mode of suspension, and devices for indicating leakage where high pressure is used. For alternating currents the two conductors must be parallel, and not more than 18in. apart. A plan of all aerial conductors is to be lodged with the Postmaster-General, and all supports are to bear a mark indicating their ownership. All conductors and supports are to be efficiently supervised and maintained by the owners, and removed when use has ceased. (*See* also Part II., Chap. 5. C.)

These Regulations do not apply, and the Section does not extend, to telegraph wires, nor to wires laid under Parliamentary powers, nor do they affect conductors entirely enclosed within buildings, or used for supplying electricity from one part of premises to another in the same occupation. Substantially similar conditions are, however, imposed under the wider Regulations issued with Provisional Orders.

* Urban Authorities, under the Public Health Amendment Act, 1890, Part ii., and the London County Council, under the London Overhead Wires Act, 1891, have since acquired powers to make bye-laws, subject to confirmation by the Board of Trade, with respect to overhead wires and their accessories not laid by undertakers under the Electric Lighting Acts.

† These are now under revision. New Regulations will be issued about the spring of 1894, and will be published with the "Digest" in book form.

‡ Owing to the length of Metropolitan fire-escapes, the Regulations issued under the London Provisional Orders require the height above the street to be 35ft. The same Regulations under both the London and Provincial Orders require the distance from a building to be 7ft. instead of 6ft.

Digitized by Google

CHAPTER II.

Parliamentary Powers.

Three methods are provided by the Acts for obtaining Parliamentary powers to supply electricity within a defined area, viz., Special Act, License, and Provisional Order.

A.—Special Act.

This method calls for but little notice. Only one Special Act* has hitherto been passed, and that under exceptional circumstances. In the absence of such it is unlikely that future applications under this head will be successful. But however this may be, it is improbable that Parliament will grant more favourable terms by Special Act than may be obtained by Provisional Order.

B.—License.

This must also be regarded as a method of secondary importance. The Board of Trade announced as early as 1883 that, except in case of applications by Local Authorities, Licenses would not be granted for large areas, such as the whole of a provincial town, or a London parish. The present tendency is to further curtailment. Only seven Licenses were granted in 1890 as against 74 Provisional Orders; and only five since. They are only now granted under exceptional circumstances, and usually on terms that a Provisional Order is to be applied for on the earliest opportunity. The following provisions apply to Licenses.

The Term cannot exceed seven years, although it may be renewed upon the same conditions as are applicable to an original grant.

The Consent of the Local Authority must be obtained in the manner specified under the head of Procedure, and if this consent is withheld, a License cannot be even applied for.

A License cannot be granted until **Three Months after notice** has been advertised, and the formalities completed, as stated under the head of Procedure.

The proceedings are regulated by (1882) § 3, and the Board of Trade Rules above referred to.

The compulsory powers of purchase by Local Authorities do not apply to undertakings authorised by License. In other respects Licenses contain substantially the same clauses as Provisional Orders.

The **Advantages of Proceeding by License** are, that it can be more expeditiously and cheaply obtained, and is not hampered by any requirements as to notices being given before fixed days in the year. It does not require confirmation by Parliament. This, however, entails the disadvantage that certain provisions, which may be valid in a Provisional Order, would be *ultra vires* in a License; notably those for enforcing payment of penalties, for which the Acts do not provide any machinery.

C.—Provisional Order.

This is by far the most important method of proceeding. The grant is made by the Board of Trade, but must be confirmed by Parliament, where the Bill may be opposed, as well as before the Board of Trade.

The proceedings are regulated by (1882) § 4, and the aforesaid Rules.

* The Metropolitan Electric Lighting Act, 1889. The Special Acts obtained in 1893, by the City of London Electric Lighting Company and the Kensington and Knightsbridge Electric Lighting Company, respectively, relating to amalgamations of undertakings, do not fall within the same category.

Digitized by Google

Notice must be served on every Local Authority within the proposed area of supply **before July 1st** in the year in which the application is to be made, and Rule 7 states that the Order will be granted only to the party by whom this Statutory Notice was given. Rule 5 also requires notice to be given to all other undertakers within the area before November 1st.

Advertisements, as described under the head of Procedure, must be published in the months of October or November following, and copies of the advertisement and a **Map** of the proposed area deposited at the Board of Trade, and at the offices of every Clerk of the Peace* and Local Authority within the area, on or before November 30th. (Rules 10 and 17.)

The Memorial applying for the Order, and documents mentioned under the head of Procedure as required to accompany it, must be lodged at the Board of Trade on or before December 21st.

The applicants must be prepared to prove compliance with the Acts and Rules by January 15th following, and proofs must be completed by February 22nd.

The confirmation Bill may be passed at any time before the end of the current Session of Parliament.

The **Order Dates** from the day when the confirming Act is passed.

The other preliminaries which are common to Licenses and Provisional Orders are described under the head of Procedure.

The **Consent of the Local Authority** is rendered necessary to the grant by (1888) § 1, but the Board of Trade have power to dispense with this consent† on sufficient grounds to be stated in a special report. Proof of such consent, or a request to dispense with it, giving reasons, must be lodged within the time above limited for proving compliance. (Rule 2.)

The liability to **Compulsory Purchase** of the undertaking, by the Local Authority, at the end of 42 years, is one of the incidents of a Provisional Order. The terms of purchase, unless varied by agreement between the parties with the consent of the Board of Trade under (1888) § 3, are laid down by (1888) § 2, which stands as follows :—

"Where any undertakers are authorised by a Provisional Order or Special Act to supply electricity within any area, any Local Authority within whose jurisdiction such area or any part thereof is situated, may within six months after the expiration of a period of 42 years, or such shorter period‡ as is specified in that behalf in the Provisional Order or in the Special Act, from the date of the passing of the Act confirming such Provisional Order, or of such Special Act, and within six months after the expiration of every subsequent period of 10 years, or such shorter period as is specified in that behalf in the Provisional Order or in the Special Act, by notice in writing require such undertakers to sell, and thereupon such undertakers shall sell to them their undertaking, or so much of the same as is within such jurisdiction, upon terms of paying the then value of all lands, buildings, works, materials, and plant of such undertakers, suitable to and used by them for the purposes of their undertaking within such jurisdiction, such value to be in case of difference determined by arbitration. Provided that the value of such lands, buildings, works, materials, and

* In Scotland the office of every principal Sheriff Clerk.

† This power has been rarely exercised since 1889, when several Provisional Orders were granted and confirmed by Parliament, notwithstanding opposition by the Local Authority.

‡ Shorter periods have been accepted by undertakers in some cases. In the County of London form the term runs from August 26, 1889.

Digitized by Google

plant shall be deemed to be their fair market value at the time of the purchase, due regard being had to the nature and then condition of such buildings, works, materials, and plant, and to the state of repair thereof, and to the circumstance that they are in such a position as to be ready for immediate working, and to the suitability of the same to the purposes of the undertaking, and where a part only of the undertaking is purchased, to any loss occasioned by severance; but without any addition in respect of compulsory purchase, or of goodwill, or of any profits which may or might have been, or be made from the undertaking, or of any similar considerations. The Board of Trade may determine any other questions which may arise in relation to such purchase, and may fix the date from which such purchase is to take effect; and from and after the date so fixed, or such other date as may be agreed upon between the parties, all lands, buildings, works, materials, and plant so purchased as aforesaid, shall vest in the Local Authority which has made the purchase, freed from any debts, mortgages,* or similar obligations of such undertakers, or attaching to the undertaking; and the powers of such undertakers in relation to the supply of electricity under this Act, or such Provisional Order or Special Act as aforesaid within such area or part thereof as aforesaid, shall absolutely cease and determine, and shall vest in the Local Authority aforesaid."

Subject to the above right of purchase by the Local Authority, a Provisional Order, unlike a License, may be "for such period, whether limited or unlimited, as the Board of Trade may think proper." (1882, § 4.) No limits have been imposed hitherto.

D.—Procedure for Obtaining a License or Provisional Order.

Advertisements of an application having been made for a License, or of an intended application for a Provisional Order, must state (*see* Rule 13) the objects of the application; the address and description of the applicants; a description of the proposed area of supply, the streets in which lines are to be laid down within a specified time; a list of streets not repairable by a Local Authority and of the railways and tramways which the applicants require powers to break up; the address of an office in London, and another in the proposed area, where printed copies of the draft License or Order can be obtained at a price not exceeding 1s. It must also inform the public that objections should be lodged by letter addressed to the Board of Trade, in case of a Provisional Order before the following January 15th, and in case of a License within two months from the first advertisement. (A note of this latter fact must also be printed at the end of the draft: *see* Rule 9.) The advertisement must be inserted once at least in each of two successive weeks in the same newspaper, circulating in the proposed area, or such other newspaper as the Board of Trade may direct, and once in the London, Edinburgh, or Dublin *Gazette*, according as the area of supply is in England, Scotland, or Ireland.

The formalities for proving the **Consent of the Local Authority** to an application for a License, or the grant of a Provisional Order, are prescribed by Rule 4. Copies of any agreement with the Local Authority must be deposited with the Board of Trade at the time of proving consent (Rule 3).

Applications must be by **Memorial** addressed to the Board of Trade, accompanied by six printed copies of the draft Order or License applied for (Rule 8).

* Clause 76 of the Model Order provides that mortgages shall not be a charge on the undertaking in the event of sale, but shall comprise the purchase-money, and every mortgage shall be endorsed with a notice to that effect.

Digitized by Google

The contents of the draft are prescribed by Rule 9, and the maps to be deposited by Rule 10.

Accompanying the memorial **there must be deposited with the Board of Trade** (Rule 11)—

1. A list of the Local Authorities whose districts are included in the area of supply. 2. A list of other undertakers* (if any) within the area. 3. A list of streets not repairable by Local Authorities, and of railways and tramways which the applicants desire to break up. 4. A list of canals and railways within the area. 5. A statement of the capital to be expended, and the mode of providing it. 6. If the applicants are a company, a copy of their Memorandum and Articles of Association. 7. A fee of £50 to cover ordinary expenses of the Board of Trade. Further expenses, if incurred in consequence of inquiries or otherwise, must be paid by the applicants in addition to the above.

The procedure where undertakers desire the consent of the Board of Trade, under (1882) §13, to enable them to break up any **street not repairable by a Local Authority,** or any **railway** or **tramway,** is prescribed by Rule 12.

The manner of **serving notices** is prescribed by Rule 7.

Objections to the grant, and copies of any clauses or amendments desired, must be delivered to the Board of Trade and to the agents of the undertakers before January 15th in the case of a Provisional Order, and within two months after the first advertisement in the case of a License (Rule 14). This rule contemplates clauses or amendments being asked for by "any Local or other public authority, company or person," and therefore opens a very wide field for objections.

The Board of Trade will hold a local inquiry, † if they consider it expedient, in cases where objectors are locally interested.

Printed Copies of the License or Provisional Order must be deposited for public inspection at the office of every Clerk of the Peace ‡ and Local Authority within the area of supply, and the undertakers must supply copies to all persons applying, at 1s. each (Rule 15).

PART II.

POSITION OF UNDERTAKERS AND RIGHTS OF THE PUBLIC AFTER PARLIAMENTARY POWERS HAVE BEEN GRANTED.

Introductory.

It is provided by (1882) § 3 (sub-section 8), that a License may make certain regulations, and Section 4 states that a Provisional Order shall be subject to like provisions. The same provisions are, however, also authorised by Section 6, which is much more comprehensive, and stands as follows :—

"The undertakers shall be subject to such regulations and conditions as may be inserted in any License, Order, or Special Act affecting their undertaking with regard to the following matters :

(*a*) The limits within which, and the conditions under which, a supply of electricity is to be compulsory or permissive.

(*b*) The securing a regular and efficient supply of electricity.

* Notice must be given to all such undertakers before November 1st (*see* Rule 5).
† There have been three such inquiries since 1889.
‡ In Scotland, principal Sheriff Clerk.

Digitized by Google

(*c*) The securing the safety of the public from personal injury, or from fire or otherwise.

(*d*) The limitation of the prices to be charged in respect of the supply of electricity.

(*e*) The authorising inspection and inquiry from time to time by the Board of Trade and the Local Authority.

(*f*) The enforcement of the due performance of the duties of the undertakers in relation to the supply of electricity by the imposition of penalties or otherwise, and the revocation of the License, Order, or Special Act where the undertakers have, in the opinion of the Board of Trade, practically failed to carry the powers granted to them into effect within a reasonable time, or discontinued the exercise of such powers; and

(*g*) Generally with regard to any other matters in connection with the undertakings.

Provided always that the Board of Trade may from time to time make such regulations as they may think expedient for securing the safety of the public from personal injury, or from fire or otherwise, and may from time to time amend or repeal any regulations which may be contained in any such License, Order, or Special Act in relation thereto; and any regulations so made or amended by the Board of Trade shall from and after the date thereof have the like effect in every respect as though they had been originally inserted in the License, Order, or Special Act authorising the undertaking, and every regulation so repealed shall, from and after the date thereof, be repealed accordingly; but such repeal shall not affect any liability or penalty incurred in respect thereof prior to the date of such repeal, or any proceeding or remedy which might have been had in relation thereto.

Any Local Authority within any part of whose district electricity is authorised to be supplied under any License, Order, or Special Act may, in addition to any regulations which may be made under the preceding provisions of this section for securing the safety of the public, from time to time, make, rescind, alter, or repeal bye-laws for further securing such safety; and there may be annexed to any breach of such bye-laws such penalties, to be recovered in a summary manner, as they may think necessary: *Provided always* that no such bye-laws shall have any force or effect unless and until they have been confirmed by the Board of Trade, and published in such manner as the Board of Trade may direct."

It is by virtue of these sections that the terms laid down in the Model Order are imposed by the Board of Trade, which will now be considered, together with other sections of the Acts, under the following titles:—

Chap. I. General obligations of undertakers and miscellaneous provisions.
„ II. Rights of undertakers.
„ III. Regulations as to laying down mains, &c., and testing same.
„ IV. Rights of the public to obtain supply, and their obligations in connection therewith.
„ V. Position of Local Authorities, County Councils, and the Postmaster-General.

CHAPTER I.

General Obligations of Undertakers and Miscellaneous Provisions.

A.—*Accounts, Maps, and other Documents to be kept, published, or deposited by Undertakers.*

Printed Copies of all Regulations affecting the undertaking issued by the Board of Trade must be served on the Local Authority, and copies supplied to all

Digitized by Google

persons applying, at a charge of 6d. each, under penalty of £5, and a similar daily penalty * (Clause 68).

Annual Accounts must be published in such form and manner as the Board of Trade may approve, by March 25th in each year, made up to the previous December 31st, and copies be supplied to all applicants at 1s. each. Penalty for default, 40s. a day (1882) § 9. These accounts are to be audited by an auditor appointed by the Board of Trade † (Clause 8). This Clause is not applicable to undertakings by Local Authorities. Orders subsequent to 1891 omit the requirements inserted in Orders hitherto, as to separate capital accounts being kept in respect of each Order.

Maps (1) of the area of supply in form required by Rule 16 must be deposited at the Board of Trade within one month from the date of the grant, (2) of the area, showing the exact position of all underground works in manner required by Clause 57, must be kept at the undertakers' principal office, and corrected once a year. All applicants may inspect, on payment of 1s., and have copies at 5s. each. Penalty for undertakers' default £10, and £2 daily penalty.

Forms of Requisition to lay mains referred to in Chapter 4, A, must be kept and supplied gratis.

B.—*Security to be Given.*

Undertakers (if not a Local Authority) must within six months, ‡ and before exercising any powers, satisfy the Board of Trade that they are in a position fully and effectually to discharge their obligations, and must make a cash deposit or give security.‖ For failure in this respect the Board of Trade may revoke the Order as to the whole or part of the area. The security will be released in equal moieties, on the certificate of the Board of Trade Inspector that an equivalent has been expended by the undertakers, or that distributing mains have been laid in all the scheduled streets, or otherwise as the Board may approve (Clause 7).

In case of the undertakers' powers being revoked, claims for compensation in respect of damage consequent upon works or other exercise of their powers, or for the cost of removal of their works, are to be a first charge on the money deposited or secured, which is to be applied rateably in satisfaction of such claims, as may be determined by a Board of Trade arbitrator (Clause 66*e*).

C.—*Amalgamation.*

Undertakers (not being Local Authorities) are forbidden,¶ under penalty of revocation, to purchase or acquire the undertaking of, or associate themselves with,

* This expression is defined in Clause 2 to mean a penalty for each day on which an offence is continued after conviction thereof.

† The Orders previous to 1892 for the Provinces direct the auditor to be appointed by the County Council, those for Scotland by the Sheriff.

‡ When anything has to be done within a fixed period, unless otherwise stated, the period is understood to date from the commencement of the Order, which is defined by Clause 3 to be the day on which the Act of Confirmation is passed.

‖ Where two or more Local Authorities' districts are involved, the deposit or security may be required to be in respect of such districts severally ; and, in such case, will be released separately. The Board generally require £1,000 in respect of each district for the Metropolis, and £500 for the Provinces. Local Authorities may, however, stipulate for larger sums, as in the case of the parish of Paddington, where the undertakers in 1890 were required to give security for £20,000.

¶ The only three Orders granted for the Provinces in 1889, namely, Birmingham, Liverpool, and Swansea (the latter being a Local Authority), do not contain this prohibition. The City of London Orders contain special powers of transfer.

Digitized by Google

any other company or person supplying electrical energy under any License, Provisional Order, or Special Act without the sanction of Parliament (Clause 4).

D.—*Liability for Nuisance, Injury, &c.*

No statutory powers are given to undertakers which will exempt them to the extent of Railway Companies from injunction or indictment for nuisance.

The existing state of the law is emphasised, but not altered in any way by Clauses 75 and 79, the one providing that "The undertakers shall be answerable for all accidents, damages, and injuries happening through the act or default of the undertakers or of any person in their employment by reason or in consequence of any of the undertakers' works, and shall save harmless all authorities, bodies, and persons by whom any street is repairable, and all other authorities, their officers and servants, from all damages and costs in respect of such accidents, damages, and injuries;" and the other, that "Nothing in the Order shall exonerate the undertakers from any indictment, action, or other proceedings for nuisance in the event of any nuisance being caused by them."

The first of these clauses might appear to extend the liability of undertakers to accidents where they have been guilty of no negligence or default. This, however, has been held not to be the case in the interpretation of similar words under the Tramways Act, 1870, section 75 (*see* Brocklehurst *v.* Manchester, &c., Tramways Company, 17 Q.B.D., 118).

E.—*Future Grants and Acts of Parliament.*

No monopoly is granted to undertakers, and (1888) § 1 expressly declares that a grant by License or Provisional Order shall not restrict subsequent grants for the same area. The Board of Trade do not, however, hastily favour competition, and decided in 1890 to refuse Orders in respect of those portions of the Metropolis which were dealt with by the Orders of 1889, on the ground that it was not desirable to interfere with the arrangements then made until further experience had been gained.*

It is also declared by Clause 80 that undertakers are not exempted from the provisions nor deprived of the benefit of any future general Act.

F.—*Revocation.*

The power to revoke a License, Provisional Order, or Special Act is given to the Board of Trade by (1882) § 6 (*f*) (quoted above), in the events therein mentioned.

The Model Order prescribes eight† occasions for the exercise of this power, namely, if the undertakers—

(1) Amalgamate with another undertaking without the authority of Parliament (Clause 4).

(2) Supply outside their own area (Clause 6).

(3) Fail to find security or make deposits as required by Clause 7.

(4) Fail to lay compulsory mains (Clause 21).

(5) Fail to execute works or supply energy as required, and are, owing to insolvency, unable fully and efficiently to discharge the duties imposed on them (Clause 63).

* The grant in 1891 of an Order to the new Cadogan and Belgrave Electric Supply Company for a part of the parish of Chelsea, in which two other Companies already held Orders, was made under circumstances treated by the Board as exceptional.

† When the Local Authority are the undertakers, Nos. 1, 2, 3, and 7 do not apply, and No. 5 is altered by omitting any reference to insolvency.

Digitized by Google

(6) Fail to comply with an order of the Board of Trade to discontinue or abate an irregularity or defect (Clause 67).

(7) Satisfy the Board of Trade that they are unable to carry on the undertaking with profit, and that it ought to be abandoned. In this case the undertakers must themselves apply for revocation (Clause 64).

(8) In addition to the above, the Board of Trade may revoke on such terms as they may think just, at any time, with consent of the undertakers and Local Authority (Clause 65).

In all these cases, except the 1st, 2nd, 6th, and last, the revocation may be partial, if the undertakers so desire, and as regards the 7th case, if the Local Authority also consent. In the 4th case it is also provided that after hearing representations from the Local Authority, the Board may suffer the Order to remain in force, subject to such conditions as they may impose, and which are thereupon to become of like force as though they had been contained in the original Order.

On revocation of an Order, the following provisions take effect (Clause 66).

Within one month after service of notice of revocation, the Local Authority may require the undertakers to sell so much of their undertaking as is comprised in the revoked area, upon the terms of the compulsory purchase section (1888) § 2. Upon such sale being effected and transfer directed by the Board of Trade, the undertaking, or the part thereof purchased, vests in the purchasers, freed of all debts, mortgages, or similar obligations, and the Order is to remain in force in favour of the purchasers. Mortgages would be a charge on the purchase-money under Clause 76.

If no purchase is effected, the Local Authority or owners of streets in which works of the undertakers have been placed may, with reasonable care, remove such works, and the undertakers must pay the costs of removal and of reinstating the streets, the amount to be settled by arbitration. After a month's default in payment, such works may be sold, and the proceeds, after defraying expenses paid to the undertakers.

G.—*Approvals, Extensions of Time, Consents and Orders of the Board of Trade.*

The form of these, their incidents, and the advertisements required are prescribed by Clauses 70, 71 and 72. Notice of an application for extension of time by undertakers must be given to the Local Authority, who are to have an opportunity of making objections thereto (Clause 73).

H.—*Notices, &c.*

The form of these and manner of service are prescribed by Clauses 61 and 62, Sundays, Christmas Day, Good Friday, Bank Holidays, and days of public thanksgiving, &c., do not count in computations of time.

I.—*Arbitration.*

Unless in any case it is otherwise expressly provided, all matters directed under the general Acts, or any License, Order, or Special Act, to be determined by arbitration, are to be determined by an engineer or other fit person nominated on the application of either party by the Board of Trade, under the Board of Trade Arbitrations, &c., Act, 1874 (1882, § 28).

Digitized by Google

J.—*Recovery of Penalties.*

Where not otherwise provided for, penalties, recoverable under Provisional Orders or Regulations made thereunder or under the Acts, may be recovered before a Court of Summary Jurisdiction. They may if the Court so direct be paid to the prosecutor (Clause 74).

The obligations of undertakers as to *Compulsory Supply* are dealt with in Chapter IV.

CHAPTER II.

Rights of Undertakers.

The general enabling provisions of the Electric Lighting Acts are contained in (1882) § 10, which is as follows :—"The undertakers may, subject to and in accordance with the provisions and restrictions of this Act, and of any rules made by the Board of Trade in pursuance of this Act, and of any License, Order, or Special Act authorising or affecting their undertaking, and for the purpose of supplying electricity, acquire such lands by agreement, construct such works, acquire such licenses for the use of any patented or protected processes, inventions, machinery, apparatus, methods, materials, or other things, enter into such contracts, and generally do all such acts and things as may be necessary and incidental to such supply."

A.—*Powers of Acquiring Land.*

This is by agreement only, the compulsory provisions of the Lands Clauses Acts being expressly excluded by (1882) § 12. Special powers are given to Local Authorities who are undertakers, by Clause 7, of Form No. 1, subject to approval of the Local Government Board as regards using lands previously acquired for other purposes.

B.—*Power to Supply Electricity.*

This power, which (1882) § 3 and § 4 enacts may be given by License or Provisional Order, is granted by Clause 9 of the Model Order within the area defined by a schedule.

Undertakers (other than the Local Authority) are forbidden under Clause 6, on pain of revocation, to erect or lay down any lines or works outside their area without the authority of Parliament or a License.

C.—*Protection of Undertakers' Property from Injury or Seizure.*

Maliciously cutting or injuring any electric line or work with intent to cut off supply is made felony by (1882) § 22, and punishable with five years' penal servitude or two years' imprisonment. Maliciously or fraudulently abstracting, or causing to be wasted or diverted, consuming, or using electricity is declared by (1882) § 23 to be larceny, and punishable accordingly. Fraudulently injuring a meter, or where supply is not charged by meter, using any lamp either larger or for a longer time than contracted for, or supplying any other person with any part of the electricity supplied by undertakers, involves, under § 18 of the Gas Works Clauses Act, 1847, a forfeit to the undertakers of £5, and 40s. daily penalty. Damaging any line, post, lamp, or other work of the undertakers, or wilfully extinguishing public lamps or wasting electricity, involves a forfeit to the undertakers of £5, in addition to

Digitized by Google

the amount of damage, under § 19 of the same Act. And under § 20 anyone carelessly or accidentally breaking, throwing down, or damaging any such line, pillar, or lamp must pay damages not exceeding £5.

In addition to the above penalty and damages, undertakers are empowered, under § 38 of the Gas Works Clauses Act, 1871, in the case of anyone wilfully or fraudulently, or by culpable negligence, injuring any line, meter, or fittings of the undertakers, or tampering with a meter, or fraudulently abstracting or consuming or using electricity, to cut off the supply until the default is made good. The existence of artificial means of committing any of the above offences is also made evidence of fraudulent intent. (As to improper use by consumers, *see* also Chapter IV. B.)

Undertakers' property is protected from distress, execution, or bankruptcy proceedings against any person in whose possession it may be by (1882) § 25.

D.—*Powers for Securing and Recovering Payments for Supply. Right of Entry on Consumer's Premises.* (*See* Chapter IV., G and K.)

E.—*Power to Break up Streets.*

This is not expressly given by the Acts, but is imported from the Gas Works Clauses Act, 1847, which is incorporated by (1882) § 12.

Undertakers are forbidden by (1882) § 13 to **break up private streets, railways, or tramways,** without the consent of the Board of Trade. Clause 10 of the Model Order gives this power as regards streets, &c., specified in a schedule, which may be afterwards added to by the Board of Trade. Clause 11 authorises **street boxes** to be placed in any street which, except so far as the Board of Trade shall otherwise direct, are to be for the sole use and under the sole control of the undertakers. No such box is to be placed above ground without the consent of the Local Authority, body, or person by whom the street is repairable. The covers must be constructed and maintained so as not to be a source of danger, and must not be removed, except at stated hours prescribed by the Local Authority, under a penalty of £5, and a like daily penalty, unless in case of emergency.

The regulations and restrictions under which these powers may be exercised are stated in the following chapter.

CHAPTER III.

Regulations as to Laying Down Mains,* &c., and Testing Same.

The sections of the Gas Works Clauses Act, 1847, which apply to this subject are Nos. 6 to 12. Some of these are practically superseded by the more elaborate provisions of the Model Order on the same subject, but Sections 10 and 11 should be noticed, which compel undertakers, under penalty of £5 a day for default, to reinstate ground broken up, convey away all rubbish, fence the works while in operation, and light them at night, also to keep the road or pavement in repair for three months after breaking up, and for 12 months as regards subsidence. Penalties for want of due diligence or care in such matters are also recoverable under Section 160 of the Public Health Act, 1875, incorporating Sections 81 to 83 of the Towns Improvement Clauses Act, 1847.

* The Provisions of the Model Order under the head of "Works" are very long and elaborate. No more than a very brief summary can be given here.

Digitized by Google

(1882) §17 also provides that the undertakers in exercising their powers are to cause as little detriment and inconvenience as possible, and make compensation for damage done, to be settled by arbitration.

A.—*Requirements before breaking up Streets, &c.*

Except in the case of repairs, renewals, or amendments of existing works, undertakers must, before proceeding, give a month's notice to the body or person liable to repair the street or bridge, or the owner of the railway, tramway, or canal to be disturbed, also to the Postmaster-General. The notice must describe the proposed works with a plan. The undertakers may execute the works, if no objection is served upon them for three* weeks after notice; but in case of objections by any of the Local Authorities or Postmaster-General, the work may only be done on conditions approved by the Board of Trade, or in case of objections by other parties, on terms to be settled by arbitration. All works must be done to the reasonable satisfaction of such owners, who may be present during their execution (Clauses 12 and 13). The repairing authority or owners may (Clause 14) give notice that they will execute the required works for and at the expense of the undertakers, and may (unless the undertakers are the Local Authority) require security for the cost, in which case the undertakers must not do the works, unless the party so giving notice neglects to do so for 24 hours after a time specified by a further requisition to be served by the undertakers not more than four or less than two† days before the time so specified. Breach of any of these regulations involves a penalty on the undertakers of £10, and £5 daily penalty; but they will be excused if the case is one of emergency, and they have complied with the requirements so far as was reasonable under the circumstances.

B.—*Mutual Facilities to Undertakers and the Owners of other Pipes, Wires, &c.*

These are granted by (1882) §15, "Subject to the provisions of this Act, and the License, Order, or Special Act, and to any Bye-laws made under this Act."

Special regulations are accordingly laid down in the Model Order to be observed by undertakers and the owners of pipes, wires, &c., under any street, as regards interference with each other's works. Clause 15 makes similar provisions to those described under (A), with respect to notices to be given to the parties whose property is to be interfered with, the right of the latter to do the work themselves, arbitration, and penalties for breach. The sewers of the Local Authority are excluded from the scope of this clause.

These mutual rights are extended by Clause 16 to the case of undertakers requiring to dig, for laying new works (other than service lines) near to any sewer, drain, water-course defence or work under the jurisdiction of the Local Authority, or any pipe or line of any gas, water, or electric supply company, or *vice versâ*. Three days' notice must be given to the parties affected, who may superintend the work and make requirements for protection of their property (and under the County of London form, do the work themselves, unless undertaken by the Street Authority). Compensation must be paid for any loss or damage entailed.

* Where the objectors are the Local Authority or Postmaster-General, this is extended to "one month," and also the month of August is not to count in the period of notice, unless the undertakers are the Local Authority. It may be remarked that apart from the special requirements of Provisional Orders undertakers would only have to give three clear days' notice before breaking up a street under the Gas Works Clauses Act, 1847, § 8.

† Under the corresponding provisions of Clause 15 referred to under B these periods are 48 hours and 24 hours.

Digitized by Google

Works must be supported in case of being undermined, and lines sufficiently insulated wherever liable to touch the pipes or lines of any gas, water, or electric supply. These must not be used as conductors without the consent of the owners and the Board of Trade. Differences are to be settled by arbitration. The penalties for breach are the same as in the preceding clauses, but are not to be enforced if the default arose through ignorance (not due to negligence) as to the position of the works affected.

C.—*Protection of Telephone Companies, &c., and Owners of Docks, Canals, Railways, &c.*

Undertakers must take all reasonable precautions so to construct their works as not to injure, by induction or otherwise, any existing or future wires used for telegraphic or telephonic communication. Before laying or commencing to use any line in a manner which may injuriously affect telegraphic or telephonic communication through wires lawfully laid, seven days' notice must be given specifying the course, nature, and gauge of the said line, the amount and nature of the current, and what earth returns (if any) will be used. The undertakers must conform to any reasonable requirements, thereupon made by the owners of such wires, and any differences between the latter and the undertakers as to the reasonableness of such requirements are to be settled by arbitration. The arbitrator may direct alterations to be made, unless he is of opinion that wires laid since those of the undertakers have been laid unreasonably near them. These provisions do not apply to repairs or renewals, provided the course, nature, and gauge of the line, and the amount and the nature of the current are not altered. The penalties for breach are £5, and 40s. daily penalty, with the same exemption as in the last clause in case of ignorance (Clause 18). No part of a circuit may be connected to earth unless approved by the Board of Trade and the Postmaster-General (Clause 9).

Undertakers must, at the request of owners of canals, docks or basins, on having reasonable facilities afforded for placing their works round the same, or any land about to be used for such purposes, place or remove the said works accordingly. Disputes on the subject are to be settled by arbitration (1882, § 16). Besides the notices required and protection given by Clause 13 (*see* A, *ante*), Clause 17 expressly forbids undertakers to injure the works or obstruct the traffic of any railway or canal company.

D.—*Wires above Ground.*

These may not be erected along, over, or across any street without the consent of the Local Authority (1882, § 14). The Model Order (Clause 9) further forbids any line to be placed above ground without the consent of the Board of Trade, except within premises in the sole occupation or control of the undertakers, and except so much of any service line as is necessarily so placed for the purpose of supply. Lines placed above ground before the grant must be removed within a year, under a penalty of £10, and £5 further daily penalty, and on failure may be removed by order of a Court of Summary Jurisdiction (Clause 81). (*See* also Part I., Chapter I., and E, below).

E.—*Precautions for Public Safety.*

The Act of 1882, § 6, as quoted above, empowers the Board of Trade from time to time to make, amend or repeal regulations for securing public safety. It also

Digitized by Google

empowers the Local Authorities to make bye-laws * on the same subject. Under the Model Order (Clause 9) undertakers are made subject to such regulations and conditions for securing the safety of the public, and for insuring a proper and efficient supply as the Board of Trade may impose. In 1890, the Board framed a set of such regulations, which have been issued in substantially the same form to all undertakers.† The first part relates to safety, and the second part (*see* Chapter IV., E) to supply.

The Regulations as to safety require as follows:—

The supply must be delivered at the consumer's terminals at low pressure (*i.e.*, not exceeding 300 volts continuous, or 150 volts alternating). A high-pressure supply (*i.e.*, up to 3,000 volts) may only be delivered to a consumer for special purposes with the approval of the Board of Trade on a joint application of undertakers and consumer. Extra high pressure (*i.e.*, above 3,000 volts) is confined to premises in the sole occupation of the undertakers. Precautions and rules are laid down for avoiding excessive currents, for protection from lightning, as to laying high-pressure conductors and insulation thereof, the use of instruments for immediately indicating leakage, the taking and recording by the undertakers of weekly insulation tests, the nature of conduits used as receptacles for conductors, and for avoiding accumulation of gas or water in street boxes, or electrical charge on exposed parts thereof, also in the case of conversion from high to low tension, for preventing the low-pressure lines and consumer's wires from attaining a dangerous potential. Undertakers are made responsible for all their apparatus upon a consumer's premises being maintained in safe condition, and must take precautions against fire. If an earth connection is discovered on a consumer's premises of resistance not exceeding 5,000 ohms, or if the consumer refuses to allow his wires to be tested after due notice (*see* chapter IV., I), the supply is to be‡ cut off until the defect is rectified; but if the consumer takes a maximum power exceeding 25,000 watts, his wires may be divided into separate circuits, each of whose insulation resistance must exceed 5,000 ohms. The provisions as to aerial conductors are substantially similar to those issued under (1888) § 4 (*see* Part I., Chapter I.). The penalty for every default is £10, and a like daily penalty. (For a complete copy of these Regulations *see* pages 112-119.)

Clause 67 also specially provides for the intervention of the Board of Trade in the event of undertakers' works being defective, or not in accordance with regulations, or attended with danger to public safety, or injuriously affecting any telegraphic line of the Postmaster-General. Any requirements thereupon made by the Board must be complied with under penalty of £20 a day, or the Board may forbid the use of any line until their order is complied with under penalty of £100 a day, or under certain circumstances revocation.

Under (1882) § 14, a Court of Summary Jurisdiction is empowered, upon complaint made, to order the removal of any overhead wires which are or appear likely to become dangerous, notwithstanding that the same may have been erected with the consent of the Local Authority.

---

* No such bye-laws have been made hitherto by any Local Authority.

† These are now under revision, and a new set of Regulations will be issued early in 1894.

‡ A copy of Regulation 25, which enables a consumer upon payment of the prescribed fee to demand a test by an Electric Inspector, must be endorsed on the notice to be given by the undertakers of cutting off the supply.

Digitized by Google

F.—*Electric Inspectors and Testing.*

Electric Inspectors may be appointed by the Local Authority,* or if the latter make no appointment, *or imperfectly attend to the matter*, the Board of Trade may appoint on the application of any consumer or of the undertakers.

Electric Inspectors' duties are: (*a*) The inspecting and testing periodically,† and in special cases, the undertakers' lines and works, and the supply given; (*b*) the certifying and examination of meters; and (*c*) such other duties as may be required by Provisional Orders or regulations made under them.

The Local Authority, with the approval of the Board of Trade, may prescribe the manner and times of performing these duties, and the fees to be taken (Clause 33), and may pay any Inspector a salary, either in addition to or in substitution for the fees he is to charge (Clause 34).

The Board of Trade may also appoint an Electric Inspector to inquire and report as to any accident, or as to the manner in which the provisions for public safety have been complied with (Clause 35).

Testing is to be carried out in such manner as the Inspector thinks fit, and at such suitable hours as in his opinion will least interfere with the supply, but he is not, without a special order of the Board of Trade, to have access to the mains at other points than those reserved by the undertakers for their own access. The undertakers are to have notice before testing, and are not to be responsible for interruption of the supply caused or required by the Inspector (Clause 36).

When required by any consumer, and on payment of the prescribed fee, Inspectors are to test the variation of pressure at the consumer's terminals, and make such other tests as may be necessary for determining whether the undertakers have complied with their duties (Clause 37).

Undertakers must establish such **testing stations** as may be reasonably required by the Local Authority,‡ and place instruments therein approved by the Board of Trade, and make proper connections, and supply energy for testing. Any dispute between the Local Authority and the undertakers as to what may reasonably be required under this clause is to be settled by arbitration (Clause 38). They must set up at all places whence they supply energy by distributing mains such instruments, and keep such records of their readings, as the Board of Trade may require, and must keep in efficient order the above instruments, and those at testing stations. Any Electric Inspector may examine and record these readings at such times and in such manner as the authority appointing him may direct (Clauses 39 and 40), and he has right of access at all reasonable hours to the testing places and premises of the undertakers, for the purpose of testing their lines and instruments, and ascertaining if they are in order, and if not, he may require them to be put in order forthwith (Clause 41).

* If the undertakers are the Local Authority, Inspectors are appointed and their duties regulated by the Board of Trade, and the Local Authority have to pay such salaries as the Board may prescribe, in which case the fees will go to the local rate. In the County of London the County Council have the appointment and control of Electric Inspectors instead of the Local Authority, and the words in italics do not apply. In the parish of Chelsea, however, the Local Authority have retained the power of appointment, under the Chelsea Electric Lighting Order, 1886, and the new Cadogan and Belgrave Electric Lighting Order, 1891.

† Any particular portion of a main is not to be tested oftener than once in three months without a special order of the Board of Trade.

‡ If the Local Authority are the undertakers, this is settled by a Court of Summary Jurisdiction upon the application of ten consumers.

Digitized by Google

The undertakers' representative may be present at all tests and inspections, but may not interfere therein (Clause 42).

A report of the test is to be made on the following day to the undertakers and the party requiring the same, and is to be received in evidence. Either party may appeal against it to the Board of Trade, whose decision is final (Clause 44).

The Inspector's fees and reasonable expenses are to be paid by the undertakers, unless his report, or the Board of Trade, decides that the consumer is at fault, when the latter is to pay (Clause 45).

Default by undertakers to afford all facilities for the execution of the above provisions, or otherwise in complying therewith, involves a penalty of £5, and £1 daily penalty (Clause 43).

CHAPTER IV.

Rights of the Public to Obtain Supply, and their Obligations in Connection Therewith.

It is enacted by (1882) § 19, that everyone within the undertakers' area shall be entitled to a supply of electricity upon the same terms, "except in so far as is otherwise provided by the License, Order, or special Act." Section 6 (*a*) also provides for regulations being inserted with regard to "the limits within which and the conditions upon which the supply is to be compulsory or permissive." By virtue of these sections full provisions on the subject have been inserted in the Model Order, which must be taken to be substituted for the more sweeping obligation that would otherwise exist under Section 19. These provisions are as follows:—

A.—*Compulsory Distributing Mains to be Laid* (Clauses 19 to 24).

Undertakers must within two years lay suitable and sufficient distributing mains for the purpose of general supply throughout certain scheduled streets. At any time after the first 18 months, they may also be required to lay such mains in every other street within their area, upon the following conditions being complied with. A requisition in a form to be supplied gratis by the undertakers must be served upon them by six* or more owners or occupiers in the street specified, or by the Local Authority controlling public lamps therein. In the former case, if the undertakers within 14 days after service so demand, the requisitionists must within 14 days after such demand, or after an arbitrator's award if the demand is disputed, guarantee that such supply shall be taken for three* years, as will at current charges to ordinary consumers pay a reasonable annual sum, to be specified in the demand, and must also, if the demand so requires, give security for payment thereof. Disputes as to the reasonableness of the sum or security demanded are to be settled by arbitration, but the annual sum demanded is not without the authority of the Board of Trade to exceed† "20 per cent. upon the expense of providing and laying down the required distributing mains, and any other mains or additions to existing mains which may be necessary for the purpose of connecting such distributing mains with the nearest available source of supply." The Board of Trade, on

* Under the County of London Form only two persons need join in the requisition, and the period of guarantee is two years.

† The Orders granted in 1889 contemplate an annual sum "not less than 20 per cent.," instead of "not exceeding 20 per cent."

Digitized by Google

application by the undertakers within 14 days from service of the requisition, may absolve them altogether from the obligation to lay a main, or may vary the terms if the Board consider the circumstances render the requisition unreasonable. In the latter case the undertakers' demand above-mentioned may be served within 14 days from the Board's decision. If the requisition relates to a private street, which the undertakers are not authorised to break up, they must apply to the Board of Trade for leave to break it up under (1882) § 13, and if leave is refused the requisition is not binding. A Local Authority must, within 14 days after serving such a requisition, tender an agreement to take a supply for three years for such lamps in the street as they control. The mains must be laid within six months of the above formalities being completed.

When undertakers (not being the Local Authority) propose to lay a line in any street for supplying a particular consumer, and not for general supply, they must give 28 days' notice to the Local Authority and all persons whose premises such line will pass. Thereupon if two or more of such persons so require, in accordance with the provisions above stated, the undertakers must lay a distributing main.

B.—*Right of Consumers to obtain Supply.*

Any owner or occupier within 50 yards of a distributing main may require the undertakers "to give and continue" a supply to his premises, by serving them with a notice specifying the premises, the maximum power to be supplied, and a reasonable date for commencement of the supply. The undertakers must thereupon lay the necessary lines, but the consumer must pay the cost of the lines laid upon his property, and of so much outside it as exceeds 60ft. from the main. He must also contract for two* years' supply of a sufficient amount to pay at least 20 per cent. per annum on the undertakers' outlay on such lines, and find security† for such payment if required. The maximum power demanded must be reasonable, and must not be altered without a month's notice to the undertakers, and payment of all expenses consequent on such alteration. The undertakers may refuse to supply, unless reasonably satisfied that the consumer's fittings are in good condition, and may cut off the supply so long as the consumer uses it in such a way as to improperly interfere with the supply to others. Differences as to alleged defects in fittings, &c., improper use of the supply, what consumption may be reasonably anticipated on any premises, or the reasonableness of expenses under this heading, are to be settled by arbitration (Clauses 25 and 26). Also (1882) § 18, while forbidding undertakers to prescribe any particular form of lamp, provides against improper use of the supply.

C.—*Supply to Public Lamps.*

Undertakers must, on reasonable notice from the Local Authority, supply any public lamp within a distance of 75 yards from any distributing main (Clause 27).

* The Orders granted in 1889 here read "three years."

† In this and other cases where security is required to be given, either to or by undertakers, the amount and nature of the security, whether by deposit or otherwise, is, in default of agreement, to be settled by a Court of Summary Jurisdiction. In case of a deposit the parties to whom security is given must pay 4 per cent. [under the Orders of 1889 and 1890, the rate is 5 per cent.], interest on every sum of ten shillings deposited for every six months it remains in their hands (Clause 69).

Digitized by Google

D.—*Penalties.*

Default in complying with obligations stated under A entails a penalty of £5* a day, and if the Board of Trade are of opinion in any case that such default is wilful and unreasonably prolonged, they may, after considering any representation by the Local Authority, revoke the Order as to the whole, or, with the consent of the undertakers, any part of the area of supply (Clause 21). The penalties under B and C are 40s. a day for every default as regards private consumers, and the same for each public lamp, the total penalties not to exceed £50 a day in respect of defaults not being wilful. No penalty is to be inflicted if the default is caused by inevitable accident or *force majeure*, or is of an unimportant character (Clause 28).

E.—*Regulations as to Supply.*

These are issued by the Board of Trade under (1882) § 6 and Clause 10 of the Model Order, and for the present are shortly as follows:—(For a complete copy *see* pages 112-119.)

(1.) One week before commencing supply through any feeding, charging, or distributing main, the undertakers must serve a notice on the Local Authority.

(2.) The supply is to be maintained constant, and sufficient for all consumers entitled. It may be discontinued for the purpose of testing at such intervals as the authority by whom inspectors are appointed may permit, and for any other purposes connected with the efficient working of the undertaking at such intervals as the Board of Trade may think expedient. Notice of such discontinuance and its probable continuance is to be served on the Local Authority.

(3.) Distributing mains must be so arranged that if any portion be interrupted for more than an hour, not more than 200,000 watts will be stopped, or 80 consumers affected. Reasonable notice of stoppage is to be given to consumers.

(4.) A constant "standard pressure" is to be maintained in the mains which may be different for different portions. Variations from the standard must not exceed three per cent. in case of low pressure, or two per cent. of high pressure, and these changes must not be so *un*frequent as to cause unsteadiness.

(5.) Undertakers must give notice of the "standard pressure" for each pair of mains, and this is not to be altered without leave of the Local Authority, subject to an appeal to the Board of Trade.

(6.) Undertakers must declare a pressure at each consumer's terminals, which, unless otherwise agreed, must not be greater than 115 volts, nor less than 45 volts, and must not be altered except in consequence of an authorised alteration in the "standard pressure." In case of transformation on the consumer's premises, they must give a choice of two pressures, one approximately half the other.

(7.) Variations from the "declared pressure" must not exceed four per cent.

(8.) Penalty for breach of these regulations, £5, and a like daily penalty.

F.—*Method of Charging for Supply.*

It is laid down by (1882) § 20, that the undertakers shall not, in making any agreements for supply, show any undue preference, but, save as aforesaid, they may make such charges as may be agreed upon, not exceeding the limits of price imposed by the License, Order, or Special Act.

* This penalty does not apply if the undertakers are the Local Authority, but the Board of Trade may revoke the Order.

Digitized by Google

The Model Order draws a distinction between "general supply," *i.e.*, the supply to ordinary consumers, and "supply to one or more consumers under special agreement" (Clause 2), and provides that, subject to the right of consumers to be charged according to one of the methods hereafter described, undertakers and consumers may make what agreements they please as to price and mode of charging (Clause 29).

The supply to ordinary consumers, unless they otherwise agree, is to be charged for in Board of Trade units,* to be ascertained by a certified meter (as defined under H), and measured either—

(1.) By the actual quantity of energy supplied, *i.e.*, the meter must measure such units directly; or

(2.) By the electrical quantity supplied, in which case the units are to be ascertained by the product of such quantity, and the "declared pressure" at the consumers' terminals.

(3.) By such other method as may for the time being be approved by the Board of Trade. Consumers may, however, object to any method but the first two.

Before commencing supply through any distributing main, undertakers must give notice to the Local Authority by what method they propose to charge for supply through that main. They must give a month's notice, both to the Local Authority and every consumer supplied from it, before changing the method (Clause 29), and also (Clause 55) pay consumers' reasonable expenses, if a change of meter is involved.

Under the County of London Form, the **Maximum Price** is 13s. 4d. per quarter for any quantity up to 20 units, and beyond that 8d. per unit; but the Board of Trade may, on the application of the London County Council, or the Local Authority, or the undertakers, revise these prices, or the method of charging, every seven years, dating from August 26, 1889. The rule for the Provinces is the same, except that the seven year periods run from the commencement of the Order, but the Board of Trade will allow a different maximum, if special grounds are shown (Clause 30).

The price for public lamps is to be settled by agreement with the Local Authority, or failing that, by arbitration, regard being had to the circumstances of the case, the distributing mains which have been laid for the purpose, and the prices charged to ordinary consumers in the district (Clause 32).

G.— *Recovery of Charges and Security for the same.*

Charges for supply, or for meters or fittings, may be recovered summarily as a civil debt, but not as a penalty, the terms of Section 40 of the Gasworks Clauses Act, 1871, being limited in this respect by (1882) § 12. The matter would therefore be dealt with under the Summary Jurisdiction Act, 1879. Arrears due from an outgoing tenant cannot be recovered from the incoming tenant, unless the two tenants have so agreed (Gasworks Clauses Act, 1871, Section 39). Under (1882) § 21, the supply may be cut off until arrears, with expenses of cutting off, are paid.

* This unit is defined as the energy contained in a current of 1,000 amperes flowing under an E.M.F. of one volt during one hour.

Digitized by Google

A consumer's supply may also be cut off under Clause 25, if he neglects to give security for his future payments, for seven days after notice from the undertakers requiring him to do so.

H.—*Meters, &c.*

A "**certified meter**" is defined by Clause 47 as a meter certified by an Electric Inspector to be a correct meter, and to be of some pattern, and to have been fixed and connected with the service lines in some manner, approved by the Board of Trade. If the meter is altered, unfixed, or disconnected, it ceases to be "a certified meter" until re-certified.

Undertakers must, if required by a consumer, supply, fix, and connect an appropriate meter, and get it certified, but may require prepayment of a reasonable price for the meter, or security to be given, or a hire* agreement entered into. Unless otherwise agreed, they are to keep a hired meter in repair at their own expense. They have no power to prescribe any particular form of meter, but, subject to the above provisions, consumers may use what meters they please. Undertakers may, however (*see* Clause 56), place a second meter at their own expense upon the consumer's premises, being of a pattern and fixed and connected in a manner approved by the Board of Trade. This, except by agreement, can only be placed between the mains and the terminals of the consumer's premises.

Consumers must not connect or disconnect any meter to be used as aforesaid without 48 hours' notice to the undertakers, under penalty of 40s. (Clause 50). They must keep their own meters in proper order at their own expense, otherwise the supply may be cut off. The expenses of taking off, removing, testing, inspecting and replacing such a meter, and procuring it to be re-certified, are to be paid by the consumer, if it is out of order, otherwise by the undertakers (Clause 51).

Every **Electric Inspector must** when required by the undertakers or any consumer, and on payment of the prescribed fee, examine any meter and certify the same, if he considers it entitled to be so certified (Clause 48). He is to settle differences between undertakers and consumers as to a meter being in proper order, or as to the value of the supply, and may order by whom the costs of proceedings before him are to be paid. His decision is final. Subject, as aforesaid, the register of the meter is to be conclusive evidence, in the absence of fraud, of the value of the supply. If the Local Authority are the consumers in question, then a Board of Trade Inspector is to decide (Clause 54).

I.—*Rights of Entry on Consumers' Premises.*

The right of entry upon consumers' premises is given to undertakers by (1882) § 24 at all reasonable times, to inspect, fix, connect, test, take off, or replace lines, meters, accumulators, fittings, works, and apparatus belonging to them, and to ascertain the quantity consumed or to cut off the supply and remove their property, they making good all damage caused thereby. (*See* also Clause 51.) They have also a right (under No. 23 of the Board of Trade Safety Regulations) to enter a consumer's premises after giving an hour's notice if they are reasonably satisfied that an earth connection exists there such as to be a source of danger.

* Power to let meters and fittings thereto for hire is specially granted by Clause 52.

CHAPTER V.

POSITION OF LOCAL AUTHORITIES, COUNTY COUNCILS, AND THE POSTMASTER-GENERAL

A.—*Local Authority.*

This term is **defined** by (1882) § 31, and the Schedule to the Act. It means in the City of London the Commissioners of Sewers; in the rest of the Metropolis the Vestries or District Boards, except as regards such parts as the late Metropolitan Board of Works were authorised to light, for which the London County Council have become the Local Authority. In the remainder of England and Wales, and in Ireland, the Urban and Rural Authorities are indicated. In Scotland, under the Schedule to the Electric Lighting (Scotland) Act, 1890, in places within the jurisdiction of Police Commissioners, these Commissioners, the Town Council, or the Gas Commissioners are the Local Authority according to circumstances; elsewhere the County Council.

The same Schedules also define the term "Local Rate" for each case.

The **rights and powers of Local Authorities,** with respect to undertakings within their jurisdiction, have been stated in the preceding chapters, and it remains only to add something as to their position on becoming **themselves undertakers,** which they may do, either under a License (1882) § 3, or a Provisional Order (1882) § 4. They can acquire these powers (1) by original grant, in which case under (1882) § 3, sub-section 6, a resolution must be passed at a special meeting, held after a month's previous notice, or (2) by compulsory purchase, taking effect either at the expiration of the period limited in the Vendors' Provisional Order, or upon revocation thereof.

They have the following **special advantages over other undertakers.**

As regards Application for powers they are practically in sole possession of the field; since, besides the statutory requirements as to their consent to other applications, the Board of Trade will, except under special circumstances, always prefer them to other applicants. (*See* Note at the end of Board of Trade Rules.)

As regards Finance, they may apply the Local Rate to pay the expenses of their own application, and of their opposition to others (1882) § 7, also to afford security* for borrowed capital (1882) § 8, and to meet any deficiency of income (Model Order Form, No. 1, Clause 52). No deposit or security is required of them, and although their powers are liable to be revoked for neglect to lay compulsory mains, no pecuniary penalty can be exacted for default in this respect. Also their maximum rate of charge is not liable to revision every seven years.

Finally, they are not precluded from supplying outside their own area, nor forbidden to acquire other undertakings, whilst the facilities afforded of transferring their own will enable them to sell or farm out their statutory powers with advantage. This **power to transfer their powers, duties and liabilities,** is given by Clause 59 of Form No. 1, subject to the consent of the Board of Trade. One month before the draft deed of transfer is submitted to the Board, advertisements must be issued giving particulars of the proposed transfer, and stating where copies of the draft can be obtained at a charge of 6d. each. If the transferees are guilty of default, such as might entail revocation of the Order, the Board may instead of revoking permit the Local Authority to resume the

* This is the more important when it is remembered that other undertakers can only mortgage their undertaking subject to the liability of revocation and compulsory purchase.

Digitized by Google

undertaking, and any question thereupon arising between them and the transferees are to be settled by the Board. Default in supplying printed copies of the deed involves a penalty of £5, and a like daily penalty.

Surplus Revenue, after forming a reserve fund (if thought fit), not exceeding one-tenth of the capital expenditure, is to be applied to public improvements or reduction of loans, but any excess beyond 5 per cent. per annum on such capital expenditure is to be applied in reduction of the price of supply.

Under the County of London Form a Local Authority owning any **subway** may serve notice on undertakers requiring them to use the same for laying their lines, and after such notice the undertakers so served may not break up any street where there is a subway, and must pay a reasonable rent for the use thereof, to be settled by arbitration in default of agreement.

B.—*County Councils.*

It will have been seen that County Councils **are not Local Authorities**, except in Scotland and in that comparatively small part of London which the late Metropolitan Board of Works were authorised to light.

Except as regards audit of accounts, under Clause 8 of the Orders granted before 1892, or interference with streets or bridges repairable by the County, County Councils are not, as a rule, concerned in the affairs of undertakers.

An exceptional position has, however, been conceded to the London County Council, under the Model Order Form No. 3, with respect to the following matters:

They have the same rights as the Local Authority to receive notice from undertakers before changing their method of charging for supply, and to make representations to the Board of Trade with a view to revision of the maximum every seven years, also to receive notices required by the Board of Trade Regulations when undertakers commence or discontinue supply through any main. Their rights over such streets and sewers as they are liable to repair are also protected in the same manner. They stand in the place of the Local Authority under the clauses which deal with the prohibition of lines above ground, the appointment and direction of Electric Inspectors,* and the consent required under the above Regulations to any suspension of supply or alteration in the "standard pressure."

C.—*Postmaster-General.*

It has been seen from the preceding pages that the Postmaster-General's lines are protected by various provisions mentioned in Chapter III., A, C, and E. He may also, under Clause 57, require undertakers, in addition to the map of underground works to be kept for public inspection, to furnish him with sections on such scale as the Board of Trade may prescribe, showing the levels of all such works.

The above provisions are declared by Clause 77 to be in addition to, and not in modification of, the provisions of the Electric Lighting Acts and the Telegraph Acts, 1863 to 1885; and although undertakers may have complied with all the requirements of the Postmaster-General under Clause 12 (*see* Chapter III., A), yet the concluding paragraph of that clause states that they will not be exempted from any legal penalty or obligation in case a telegraph line should be at any time injuriously affected.

* Subject to the exceptions stated in the note on page 103.

Digitized by Google

(1882) § 35 precludes any Clause being inserted in a License or Provisional Order which would affect his **telegraphic monopoly.**

(1882) § 26 provides that none of his lines may be altered, except subject to the Telegraph Act, 1878, of which Sections 2 and 7 to 12 are incorporated; that undertakers must not lay any line or do other work which might injuriously affect the Postmaster-General's lines, either by induction or otherwise, or which come within ten yards thereof, without giving him not more than twenty-eight or less than seven clear days' notice, specifying the course and gauge of the proposed lines, and they must conform with his reasonable requirements, to be settled by arbitration in case of difference. Repairs and connections with mains, where the direction of the line to be laid crosses a line of the Postmaster-General at right angles at the nearest point, and so continues for six feet on each side thereof, are excepted from these provisions.

The penalties for breach are the same as those under the provisions stated in Chapter III., A, and a penalty of £50 a day is added for wilfully interrupting telegraphic communication. Undertakers are, however, absolved from penalties if the case was one of emergency, and they have given immediate notice at the nearest postal telegraph office, stating why they proceeded without the statutory notice.

Under the Telegraph Act, 1878, the Postmaster-General can give a counter-notice to the undertakers, stating either that he will do their work for them, or requiring them to proceed under his supervision. In either case they are to pay his expenses.

(1888) § 4 also gives the Postmaster-General jurisdiction over the electric lines of persons who are not undertakers under the Acts, and may require these to be used only in accordance with such conditions and regulations as he may prescribe, under penalty of £20 for neglect, and removal of the offending line upon the order of a Court of Summary Jurisdiction. Under the Board of Trade Regulations as to aerial conductors not erected by undertakers, mentioned in Part I., a plan of all such conductors must be lodged with the Postmaster-General, who may require alterations to be made, and all reasonable precautions must be used to prevent injurious affection of telegraph circuits by induction or otherwise.

[The foregoing DIGEST of the Electric Lighting Laws is published separately, together with the new Board of Trade Regulations, the London County Council Regulations as to Theatre Electric Lighting, &c.; price 2s. 6d., post free. Another book which may be usefully consulted is, "THE LAW RELATING TO ELECTRIC LIGHTING," written by Messrs. G. S. Bower and W. Webb, which deals fully and exhaustively with the subject, and has recently been entirely re-written; the price is 12s. 6d. For these amounts either book will be forwarded, post free, by "THE ELECTRICIAN" Printing and Publishing Company (Limited), Salisbury Court, Fleet Street, London, E.C.]

THE BOARD OF TRADE REGULATIONS.*

THE following are the Regulations and Conditions for securing the safety of the public, and for ensuring a proper and sufficient supply of electrical energy, made by the Board of Trade under the provisions of the Electric Lighting Acts, 1882 and 1888. For the Regulations issued with Provincial Orders, the following alterations should be made :—

In No. 26 of the Safety Regulations for "35ft." read "30ft." In the Supply Regulations omit the words "County Council" where they occur in conjunction with "Local Authority," and where they occur alone substitute the words "Local Authority."

Definitions.

In the following regulations :—

The expression "the Order" means the ———— Lighting Order, ——.

The expression "the undertakers" means the undertakers for the purpose of the Order.

The expression "consumer" means any body or persons supplied or entitled to be supplied with energy by the undertakers.

The expression "consumer's terminals" means the ends of the electric lines situate upon any consumer's premises and belonging to him at which the supply of energy is delivered from the service lines.

The expression "consumer's wires" means any electric lines on a consumer's premises which are connected with the service lines of the undertakers at the consumer's terminals.

The expression "aerial conductor" means any conductor which is placed above ground and in the open air.

The expression "pressure" means the difference of electrical potential between any two conductors through which a supply of energy is given, or between any part of either conductor and the earth; pressure on any alternating-current system being taken to be the equivalent of pressure on a continuous-current system when it produces an equal heating effect if applied to the ends of a thin stretched wire or carbon filament; and

(*a*) Where the conditions of the supply are such that the pressure cannot at any time exceed 300 volts, if continuous, or the equivalent of 150 volts, if alternating, the supply shall be deemed a low-pressure supply;

(*b*) Where the conditions of the supply are such that the pressure may exceed the limits of a low-pressure supply, but cannot exceed 3,000 volts, or the equivalent of 3,000 volts, whether continuous or alternating, the supply shall be deemed a high-pressure supply;

(*c*) Where the conditions of the supply are such that the pressure may on either system exceed 3,000 volts, or the equivalent of 3,000 volts, the supply shall be deemed an extra high-pressure supply.

Mains, service lines, and other conductors and apparatus are referred to as low-pressure, high-pressure, and extra high-pressure mains, &c., according to the conditions of the supply delivered through the same, or particular portions thereof.

Provided that in the case of conductors laid under the surface of the ground in conduits, in accordance with these regulations, and being the property or under the sole charge of the undertakers, low-pressure conductor shall mean any conductor in which the pressure between that conductor and the earth cannot at any time if continuous exceed 300 volts, or if alternating, 150 volts, or between that conductor and any other conductor laid in the same conduit cannot at any time if continuous exceed 500 volts, or if alternating, 250 volts.

* These are now in course of revision. New Regulations will be issued early in 1894. The new Regulations will be added to the "Digest" of Electric Lighting Law, published annually in "THE ELECTRICIAN" Series.

Digitized by Google

When any casing, support for conductors, conducting wire, or other metallic body is required to be efficiently connected to earth, it shall be deemed to be so connected when it is connected to metallic mains for water supply outside of buildings, or, where these are not available, to a mass of metal having a total surface of at least four square feet, buried to a depth of at least three feet in moist earth, by means of a conductor possessing a mechanical strength, and offering a passage to electrical discharges, equal to that of a strand of seven No. 16 galvanised iron wires.

The expression "daily penalty" means a penalty for each day on which any offence is continued after conviction thereof.

All other expressions to which meanings are assigned in the Order, or principal Act, have the same respective meanings in these regulations.

I.—Regulations as to Safety.

General.

1. *Low-Pressure Supply to Consumers.*—Save as hereinafter provided, the supply of energy delivered to the consumer's terminals shall be a low-pressure supply.

2. *Limitations of High-Pressure Supply.*—A high-pressure supply shall not be delivered to any consumer's terminals, except for special purposes, and with the approval of the Board of Trade on the joint application of the consumer and the undertakers, and subject to such further regulations as the Board of Trade may from time to time prescribe. But a high-pressure supply may be given to distributing or converting stations or points, or to distributing mains, in accordance with the following regulations.

3. *Limitations of Extra High-Pressure Supply.*—An extra high-pressure supply shall not be given except to distributing stations or other premises in the sole occupation of the undertakers, and with the written consent of the Board of Trade, and subject to such regulations and conditions as the Board may prescribe.

Mains and other Conductors.

4. *Maximum Current in Conductors.*—The maximum working current shall not be sufficient to raise the temperature of the conductors or any parts thereof to such an extent as to materially alter the physical condition or specific resistance of the insulating covering, if any, or in any case to raise such temperature to a greater extent than 30° Fahrenheit's thermometer; and efficient automatic means shall be provided which will render it impossible for this maximum working current by any accident to exceed such limit to the extent of 50 per centum, even for short intervals of time; and special care shall be taken that the cross sectional area and conductivity at joints are sufficient to avoid local heating, and that the joints are protected against corrosion.

5. *Lightning Protectors.*—Where any portions of any conductors are exposed in such a position as to be liable to be affected by lightning, they shall be efficiently protected against accidents by appliances of such pattern and construction as may from time to time be approved by the Board of Trade.

6. *High-Pressure Conductors Laid Above Ground.*—Where any high-pressure conductors, other than aerial conductors, are placed above the surface of the ground, they shall be completely enclosed in brickwork, masonry, or cement concrete, or in strong metal casing efficiently connected to earth.

Digitized by Google

7. *High-Pressure Conductors Laid in Subways, &c.*—Where any high-pressure conductors are laid in subways, or in the same conduits with any low-pressure conductors, they shall be completely enclosed in strong metal casing efficiently connected to earth.

8. *High and Low Pressure Conductors Laid in Proximity.*—Where any high-pressure conductor is laid within a less distance than 18in. from any low-pressure conductor, or from the surface of the ground, or where any low-pressure conductor is laid within the above-mentioned distance from any previously laid high-pressure conductor, efficient means shall be taken to render it impossible that the low-pressure conductor or the surface of the ground shall become electrically charged by any leakage from or defect in the high-pressure conductor.

9. *Continuous Insulation.*—Every high-pressure conductor shall be continuously insulated with a durable and efficient material, which shall be protected on the outside against injury or removal by abrasion, and every such conductor shall be tested for insulation after having been laid in position, and before any joints for service lines are made. The insulation resistance under these conditions shall not be less in any section of the conductor than at the rate of 100,000 ohms per mile for every volt of pressure of the supply under a testing pressure of at least 100 volts, and the undertakers shall duly record the results of the tests of each conductor or section of a conductor, and at all times permit an electric inspector to examine and take copies of such record.

10. *Minimum Insulation Resistance Allowable; Indicator of Leakage.*—The insulation resistance of any complete circuit used for high-pressure supply, including all devices for producing, consuming, or measuring energy, connected to such circuit, shall be such that should any part of the circuit be put to earth through a resistance of 2,000 ohms, the leakage current shall not exceed 0·04 ampere in the case of continuous currents, or 0·02 ampere in the case of alternating currents. Every such circuit shall be fitted with an instrument of such pattern and construction as may from time to time be approved by the Board of Trade, which shall immediately indicate any defect which may at any time occur in the insulation resistance of either conductor.

Every such circuit shall be tested for insulation at least once in every week, and the undertakers shall duly record the results of such testings, and at all times permit an Electric Inspector to examine and take copies of such record.

11. *Precautions against Sparking with High-Pressure Alternating-Current Mains.*—In the case of a high-pressure supply on any alternating-current system, where separately-insulated conductors are laid in the same conduit, or pass through the same boxes, precautions shall be taken against the discharge of electric sparks between the insulating covering of oppositely charged conductors, by providing a sufficient connection of a conducting nature from one covering to the other throughout.

Conduits.

12. *Conduits to be Durable and Strong.*—All conduits used as receptacles for conductors shall be constructed of durable material, and of ample strength to resist any pressure due to heavy traffic or other forces to which they may be expected to be subjected.

13. *Conduits to be Kept Free from Water.*—Where the conductors in any conduit are not continuously insulated, adequate precautions shall be taken to insure that no accumulation of water shall take place in any part sufficient to raise the level of the water into contact with the conductors.

14. *Conduits to be Kept Free from Gas.*—All conduits for conductors constructed in streets in which gas mains are also laid shall be efficiently protected against an accumulation of gas.

Digitized by Google

15. *Precautions with respect to Street Boxes.*—Where any street box contains high-pressure conductors, efficient means shall be taken to render it impossible that the covers or other exposed parts of these boxes, or any adjacent material forming the surface of the street, shall become electrically charged, whether by reason of leakage, defect, or otherwise; and all street boxes shall be efficiently protected against an accumulation of gas or water, and their covers so secured that they cannot be opened except by means of a special appliance.

Converting Stations.

16. *Converting Stations.*—Converting stations, or points in a system of distribution to which a high-pressure supply is given from generating stations, and from which a low-pressure supply is given to one or more consumers, and which are not on the consumer's premises, shall be established in suitable places, which are in the sole occupation and charge of the undertakers.

17. *Precautions against Contact.*—In every case where the supply is transformed at a converting station, as described in the preceding regulation, some means or apparatus approved by the Board of Trade shall be provided which shall render it impossible that the low-pressure distributing mains shall be at any time charged to a dangerous difference of potential from the earth, owing to any accidental contact with, or leakage from, the high-pressure system either within or without the converting station.

Consumers' Premises.

18. *Transformers and High-Pressure Apparatus to be Enclosed in Metal.*—Where the general supply of energy is a high-pressure supply, and transforming apparatus is installed on the consumer's premises, connected to the distributing mains by high-pressure service lines, and to the consumer's terminals by low-pressure service lines, the whole of the high-pressure service lines, conductors, and apparatus, including the transforming apparatus itself, so far as they shall be on the consumer's premises, shall be completely enclosed in solid walls, or in strong metal casing efficiently connected to earth, and securely fastened throughout.

19. *Precautions against Contact.*—In every case where any transforming apparatus is installed on the consumer's premises, as described in the preceding regulation, some means or apparatus approved by the Board of Trade shall be provided, which shall render it impossible that the low-pressure service lines and consumer's wires shall be at any time charged to a dangerous difference of potential from the earth, owing to any accidental contact with, or leakage from, the high-pressure system either within or without the transformer.

20. *Low-Pressure Apparatus to be Insulated.*—All terminals, low-pressure service lines, or other apparatus, between the transforming apparatus or other source of supply and the consumer's terminals, so far as they shall be on the consumer's premises, shall be completely enclosed in insulating cases, or coated with insulating material in such a manner that no part of them can be touched by any person without the removal of such case or coating, and, wherever exposed, shall be efficiently protected against injury to the insulation.

21. *Responsibility of Undertakers for their Lines, &c., on Consumer's Premises.*—The undertakers shall be responsible for all electric lines, fittings, and apparatus belonging to them, or under their control, which may be upon the consumer's premises, being maintained in a safe condition, and in all respects fit for supplying energy.

22. *Fire Risks.*—In delivering the energy to the consumer's terminals, the undertakers shall exercise all due precautions so as to avoid risk of causing fire on the premises.

23. *Testing Consumer's Wires for Leakage by Undertakers.*—If the undertakers are reasonably satisfied, after making all proper examination, by testing or otherwise, that a connection with the earth exists at some part of a circuit, of such

Digitized by Google

resistance as to be a source of danger, and that such connection does not exist at any part of the circuit belonging to the undertakers; then, and in such case, any officer of the undertakers, and duly authorised by them in writing, may, for the purpose of discovering whether such connection with the earth exists at any part of a circuit within, or upon, any consumer's premises, at all reasonable times, after giving one hour's notice of his intention to do so, enter any such premises and disconnect the consumer's wires from the service lines, and may require the consumer to permit him to inspect and test the wires and fittings belonging to the consumer and forming part of the circuit.

24. *Supply to be Discontinued.*—If on such testing the officer discovers that a connection exists between the consumer's wires and the earth, and that such connection has an electrical resistance not exceeding 5,000 ohms, or if the consumer does not give all due facilities for such inspection and testing, the undertakers shall forthwith discontinue the supply of energy to the premises in question, giving immediate notice of such discontinuance to the consumer, and shall not recommence such supply until they are reasonably satisfied that such connection with the earth has been removed.

Provided that in cases where the maximum power taken by any consumer exceeds 25,000 watts, the consumer's wires may be divided for the purposes of this testing into separate circuits, the insulation resistance of each of which shall exceed 5,000 ohms.

25. *Appeal to Electric Inspector.*—If any consumer is dissatisfied with the action of the undertakers either in discontinuing or in not recommencing the supply of energy to his premises, the wires and fittings of such consumer may, on his application, and on payment of the prescribed fee, be tested for the existence of connection with the earth by an Electric Inspector, or if no Electric Inspector has been appointed, by a person appointed by the Board of Trade.

This regulation shall be indorsed on every notice given under the provisions of the last preceding regulation.

Regulations as to Aerial Conductors where Erected with Necessary Consents.

26. *Height from Ground and Distance from Buildings, &c.*—An aerial conductor shall not in any part thereof be at a less height from the ground than 20ft., or where it crosses a street 35ft., or within 7ft. of any building or erection other than a support for the conductor, except where brought into a building for the purpose of supply.

27. *Service Lines from Aerial Conductors.*—Service lines from aerial conductors shall be led as directly as possible to insulators firmly attached to some portion of the consumer's premises which is not accessible to any person without the use of a ladder or other special appliance, and from this point of attachment to the consumer's terminals they shall be enclosed and protected in accordance with the preceding regulations as to service lines on the consumer's premises.

28. *Maximum Intervals between Supports.*—Every aerial conductor shall be attached to supports at intervals not exceeding 200ft. where the direction of the conductor is straight, or 150ft. where this direction is curved, or where the conductor makes a horizontal angle at the point of support.

29. *Supports, Construction and Erection of.*—Every support of aerial conductors shall be of a durable material, and properly stayed against forces due to wind pressure, change of direction of the conductors, or unequal lengths of span, and the conductors and suspending wires (if any) shall be securely attached to insulators fixed to the supports. The factor of safety for the conductors and sus-

Digitized by Google

pending wires shall be at least six, and for all other parts of the structure at least twelve, taking the maximum possible wind pressure at 50 pounds per square foot. No addition need be made for a possible accumulation of snow.

30. *Connection of Support to Earth.*—Every support, if of metal, shall be efficiently connected to earth, and if of wood or other non-conducting material, shall be protected by a lightning conductor fastened to the support along its entire length, and projecting above the support to a height of at least six inches, such lightning conductor being efficiently connected to earth.

31. *Angle of Crossing Thoroughfares.*—Where any aerial conductor crosses a street, the angle between such conductor and the direction of the street at the place of such crossing, shall not be less than 60 degrees, and the spans shall be as short as possible.

32. *Crossing other Wires.*—Where any aerial conductor belonging to the undertakers is erected so as to cross any other aerial conductor or any suspended wire used for purposes other than the supply of energy, precautions shall be taken by the undertakers against the possibility of their conductor coming into contact with such other conductor or wire, or of such other conductor or wire coming into contact with their conductor by breakage or otherwise.

33. *High-Pressure Conductors to be Insulated.*—Every high-pressure aerial conductor shall be continuously insulated with a durable and efficient material to be approved by the Board of Trade, to a thickness of not less than one-tenth part of an inch; and in cases where the extreme difference of potential in the circuit exceeds 2,000 volts, the thickness of insulation shall not be less in inches or parts of an inch than the number obtained by dividing the number expressing the volts by 20,000. This insulation shall be further efficiently protected on the outside against injury or removal by abrasion. If this protection be wholly or partly metallic it shall be efficiently connected to earth.

34. *Specification of Insulation.*—The material used for insulating any high-pressure aerial conductor shall be such as will not be liable to injurious change of physical structure or condition when exposed to any temperature between the limits of 0° and 150° Fahr., or to contact with the ordinary atmosphere of towns or manufacturing districts.

35. *Suspension of Conductors.*—Every aerial high-pressure conductor shall be efficiently suspended by means of non-metallic ligaments to suspending wires, so that the weight of the conductor does not produce in it any sensible stress in the direction of its length; and the insulated conductors and suspending wires, where attached to supports, shall be in contact only with material of highly insulating quality, and shall be so attached and guarded, that in case they break away it shall not be possible for them to fall away clear of the support.

36. *Undertakers Responsible for Supports.*—The undertakers shall be responsible for the efficiency of every support to which their aerial conductors are attached, and every such support shall be marked to indicate the ownership of the conductor.

37. *Maintenance.*—Every aerial conductor belonging to the undertakers, including its supports and all the structural parts and electrical appliances and devices belonging to or connected with it, shall be duly and efficiently supervised and maintained as regards both electrical and mechanical conditions.

38. *Unused Conductors to be Removed.*—The undertakers shall not permit any aerial conductor to remain erected after it has ceased to be used for the supply of energy, unless they intend within a reasonable time again to take it into use.

39. *Penalties.*—If the undertakers make default in complying with any of the preceding regulations they shall be liable to a penalty not exceeding £10 for every such default, and to a daily penalty not exceeding £10.

Digitized by Google

The imposition of any penalty under this regulation shall not affect the liability of the undertakers to make compensation in respect of any damage or injury which may be caused by reason of such default.

II.—Regulations as to Supply.

1. *Notice of Intention to Supply Through Mains.*—One week at least before th undertakers are ready to commence to supply energy through any feeding, charging, or distributing mains, they shall serve a notice upon the County Council and the Local Authority of their intention to commence such supply.

2. *Undertakers to Provide Constant Supply.*—From and after the time when the undertakers commence to supply energy through any distributing mains, they shall maintain a supply of sufficient power for the use of all the consumers for the time being entitled to be supplied from such main; and such supply shall, except so far as may be otherwise agreed upon from time to time between the County Council and the undertakers, be constantly maintained at such pressure as may be fixed under the provisions of these regulations. Provided that, for the purposes of testing, the authority by whom the Electric Inspector is appointed may give permission to the undertakers to discontinue the supply at such intervals of time and for such periods as it may think expedient, and that for any other purposes connected with the efficient working of the undertaking, the undertakers may, with the permission of the Board of Trade, discontinue the supply at such intervals of time and for such periods as the Board of Trade may think expedient. Where the supply is so discontinued notice of such discontinuance, and of the probable duration thereof, shall be forthwith served upon the County Council and the Local Authority.

3. *Maximum Supply from One Section of Main.*—The system of distributing mains shall be so arranged in sections that in case it becomes necessary to stop the supply through any portion of a main for more than one hour, for the purposes of repairs, or for any other reason, the stoppage of supply will in no case exceed in amount a maximum power of 200,000 watts, or extend to the premises of more than 80 consumers, and in the case of every stoppage for more than one hour reasonable notice shall be previously given by the undertakers to every consumer affected thereby except in cases of emergency.

4. *Pressure in Mains during Supply.*—During the whole of the period when a supply of energy is required to be maintained by the undertakers in the distributing mains under the Order and these Regulations, it shall be maintained at a constant pressure (in these Regulations termed "the standard pressure") to be fixed as hereinafter specified; but such standard pressure may be different for different portions of the distributing mains. Provided that the undertakers shall be deemed to have complied with the requirements of this regulation so long as the pressure does not at any point vary more than 3 per cent. from the corresponding standard pressure, in the case of a general supply at low pressure, or 2 per cent. in the case of a general supply at high pressure, unless changes in pressure recur so frequently as to cause unsteadiness in the supply.

5. *Fixing of Standard Pressure.*—The standard pressure shall be fixed by the undertakers for every pair of distributing mains, and notice of the amount of such standard pressure shall be given to the County Council before the undertakers commence to supply energy to consumers through such mains, and such standard pressure shall not be altered except by permission of the County Council, and upon such terms and conditions as the County Council may impose, and after public notice has been given during a period of one month in such manner as the

Digitized by Google

County Council may require, of the intention of the undertakers to apply for permission to alter the same. The undertakers may appeal against any decision of the County Council under this regulation to the Board of Trade, whose decision shall be final.

6. *Declared Pressure at Consumer's Terminals.*—Before commencing to give a supply of energy to any consumer, the undertakers shall declare to such consumer the constant pressure at which they propose to supply energy at his terminals. The pressure so declared at any pair of consumer's terminals shall not, except by agreement, be greater than 115 volts or less than 45 volts, if continuous, or the equivalents thereof respectively, if alternating, and shall not at any time be altered or departed from except in consequence of any authorised alteration of the corresponding standard pressure. In distribution on the three-wire system, the central terminal shall for the purposes of this regulation be considered to form a pair with either of the outer terminals, and similarly for multiple-wire systems; and, in the case of a transformation of energy on the consumer's premises, the undertakers shall give the consumer the choice of a supply at either of two different pressures, one of which shall be approximately half the other, and in such case the pressure so chosen by the consumer shall be the declared constant pressure.

7. *Variation of Pressure at Consumer's Terminals.*—The variation of pressure at any consumer's terminals shall not under any conditions of the supply which the consumer is entitled to receive, nor at any time, exceed four per centum from the declared constant pressure, whether such variation be due to the resistance of the service lines or apparatus belonging to the undertakers, or to any action or effect produced by such apparatus, for which the consumer cannot be shown to be responsible, or, partly to any variation of pressure in the distributing mains from which the supply is taken.

8. *Penalty for Default.*—If the undertakers make default in complying with any of these regulations as to supply, they shall, subject to the provisions of the Order, be liable to a penalty not exceeding £5 for every such default, and to a daily penalty not exceeding £5.

These Regulations are made subject to the power of the Board of Trade to make such further or other Regulations as they may think expedient; and nothing in these Regulations shall be construed to authorise the undertakers to lay any electric line or work their undertaking otherwise than in accordance with the Order and the principal Act, or to supply energy otherwise than by a system for the time being approved of by the Board of Trade under the Order.

THE LONDON COUNTY COUNCIL REGULATIONS AS TO THEATRE LIGHTING.

The following rules and regulations with regard to the electric lighting of theatres and other places of entertainment in their jurisdiction have been adopted by the London County Council:—

Where the electric light is permitted in such premises, it shall be on condition that a competent electrical engineer do certify in writing to the satisfaction of the Council once in six months that the system is in proper working order.

1. All such premises when lighted by electric light shall have at least three separate and distinct circuits (*a*) for the stage, (*b*) and (*c*) for the auditorium, corridors, and exits. The circuits referred to in (*b*) and (*c*) shall be so arranged that half the lights in each division of the auditorium and half those in each corridor and exit shall be on (*b*) and the other half on (*c*) circuit. When the current is supplied by a public lighting company, these circuits shall be taken separately from the street mains.

Under all circumstances complete metallic circuits must be employed. Gas and water pipes shall never form part of any circuit.

The number of lamps shall be so subdivided that no sub-circuit shall carry more than 65 amperes, and each sub-circuit shall start from a distributing board.

2. All conductors used within buildings shall be of copper, having a conductivity equal to not less than 98 per cent. of that of pure copper, and shall be so proportioned to the work they have to do that, if double the normal current be transmitted, their temperature shall not rise to above 150°F.

The conductors shall be insulated with pure and vulcanised india-rubber. The insulation resistance shall not be less than 300 megohms per statute mile, at 60°F., after one minute's electrification, when tested with at least 400 volts, and after 48 hours' immersion in water. The insulated conductors shall be protected on the outside by stout tape or braiding impregnated with preservative compound.

If it is desired to use any other means of insulation than that above specified, special permission shall be obtained from the Council, and no material shall be used which is not waterproof, or which will soften at a temperature below 170°F.

In all cases conductors conveying currents of high E.M.F. inside buildings, shall be specially and exceptionally insulated, and cased in, and the casing made fireproof. The positive and negative terminals connected to such conductors shall not be nearer to each other than 12 inches, and shall be efficiently protected from risk of contact.

Flexible conductors in connection with movable lights shall be insulated with vulcanised india-rubber, and protected on the outside by a stout braiding; should any of these flexible conductors be damaged, it shall be at once replaced. No circuit of this nature shall carry more than 10 amperes, and each circuit shall be protected by a double pole fuse.

3. All conductors shall be efficiently protected from mechanical injury.

When conductors pass through walls, fireproof floors, or ceilings, they shall be protected by iron pipes or by glazed stoneware or porcelain tubes, and precautions shall be taken to prevent the possibility of fire or water passing along the course of the conductors.

In special cases, or where necessary for protection from the depredations of rats, mice, or other vermin, armoured cables may be used. These need receive no further mechanical protection.

Digitized by Google

Lead-covered cables shall not be used unless protected by external armour of iron or steel.

Metal fastenings for fixing conductors shall be avoided; but when unavoidable some additional covering shall be used to protect the conductor, unless armoured, from mechanical injury at the points of support.

If casing be used it shall be of hard wood, and each conductor shall be laid in a separate groove; the cover shall be secured with screws. Casings shall, as far as possible, be placed in sight, and the conductors shall always be accessible.

Joints in conductors shall be avoided, but when unavoidable, they shall be electrically and mechanically perfect. Soldering fluids shall not be used in making such joints.

4. All external conductors shall be specially insulated and laid in iron pipes properly jointed, and of ample size. Such iron pipes shall be protected where necessary, and securely fixed and supported when not underground.

5. All exposed metal work, such as fittings, switch and fuse covers, &c., shall be efficiently insulated from the circuits.

All switches, cut-outs, ceiling roses, wall and floor sockets, and lampholders shall have uninflammable bases. All switches shall be of ample size to carry the currents for which they are intended without heating, and shall be so constructed that it will be impossible for them to remain in any position intermediate between the "on" and the "off" positions, or to permit of a permanent arc. All circuits shall be efficiently protected by cut-outs, placed in positions easily accessible to the staff, but inaccessible to the public. The main cut-outs shall be of such pattern and be fixed in such a position as to admit of quick replacement. All circuits carrying a current of 20 amperes or more shall be provided with a cut-out on each conductor, and the two cut-outs shall not come in the same compartment. All cut-outs shall be so constructed that fused metal in falling cannot cause a short circuit or an ignition. All cut-outs shall be so marked as to show what circuit or lamps they control. All wall or floor sockets shall be provided with fuses in their fixed portions. The sockets for the stage shall be of hard wood with metal guards, care being taken to avoid risk of ignition, and they shall be of specially substantial construction.

6. Resistances, for regulating the power of the lights, shall be mounted on incombustible bases, and shall be so protected, and placed at such a distance from any combustible material, that no part of the resistance, if broken, can fall on such material.

Principal resistances shall be placed in a fire-proof room reserved for the purpose.

7. Arc lamps shall not be used inside buildings without special permission from the Council.

When they are used, special precautions shall be taken to guard against danger from falling glass or incandescent particles of carbon. All parts of the lamps, lanterns, and fittings which are liable to be handled (except by the persons employed to trim them) shall be insulated.

8. Where there is a stage, special care shall be taken that all works in connection with the lighting of the stage are carried out in as substantial a manner as possible.

No metal work in connection with the circuits shall be exposed, or so fixed or constructed as to be liable to cause a short circuit.

Lamps on battens, footlights, &c., shall be protected by stiff wire guards, so arranged that no scenery or other inflammable material can come in contact with the lamps.

No readily combustible material shall be used in connection with any lamps on the stage in such a manner that it might come in contact with the lamps.

No soft or readily inflammable wood shall be used in connection with the lamps on the stage, and all wood shall be protected by uninflammable material

Digitized by Google

from the possibility of ignition by an arc between any two parts of the two conductors, or by heated particles from any conductor or part of a conductor which may connect together the two main conductors.

Where a number of lights, as in the footlights, battens, &c., are supplied under control of one switch, and protected by one single or double pole cut-out, as the case may be, the conductors shall be maintained throughout of such a section that they will be efficiently protected by the cut-outs against heating.

The leads to the battens shall be specially guarded, particularly at the points where they join on to the battens, and a sufficient length shall be allowed to prevent the leads receiving any injury through any movement of the battens.

The battens shall be suspended by at least three wire ropes attached to insulators on the battens.

On no account shall the same battens be adapted for both gas and electric light.

9. A switchboard, containing all the necessary switches, cut-outs, and other fittings for the control and regulation of the stage lighting, shall be fixed in some convenient position overlooking the stage. This board shall be inaccessible to all but the persons employed at such premises to work it.

10. Boilers, steam engines, gas engines, and dynamos, when used for the supply of electricity to such premises, shall be placed in such positions as shall be sanctioned by the Council.

Gas engines shall be placed in rooms so adequately and continuously ventilated that no explosive mixture of gas can accumulate by any leakage through the engine in the event of any of the gas cocks being left turned on. A hood, connected with a pipe carried into the external air, shall be fixed over the ignition tube when this is used.

11. Primary or secondary batteries shall be placed in rooms so adequately ventilated that no fan shall be necessary. The batteries shall be well insulated.

12. Transformers used to transform either direct or alternating currents, together with the switches and cut-outs connected therewith, shall be placed in a fire and moisture proof structure. Where the primary current is of high potential, such structure should be preferably outside the building. No part of such apparatus shall be accessible except to the person in charge of its maintenance.

No transformer which, under normal conditions of load, heats above 130°F. shall be used.

Transformer circuits shall be so arranged that under no circumstances shall a contact between the primary and the secondary coils lead an E.M.F. of high pressure into the building. The term high pressure means in all cases pressure above 200 volts.

13. The insulation resistance of a system of distribution shall be such that the greatest leakage from any conductor to earth, when all branches are switched on, the lamps and motors being removed, shall not exceed one fifteen thousandth part of the total current intended for the supply of the said lamps and motors, the test being made at the usual working electromotive force, provided that this rule shall not be held to justify a lower insulation resistance than 5,000 ohms, nor require one higher than 5 megohms.

14. The generating plant and switching gear shall be in the hands of thoroughly competent manipulators, and the engine-room (if any) shall be inaccessible to the general public, and shall, where possible, have an independent entrance.

15. A plan of the wiring shall be always kept in a prominent position in the office of the manager of such premises.

Digitized by Google

RULES AND REGULATIONS FOR THE PREVENTION OF FIRE RISKS ARISING FROM ELECTRIC LIGHTING, &c.

[The Fire Risk Rules included in these pages have been made the basis upon which Electric Lighting Risks are accepted in Great Britain, India, and nearly the whole of the British Colonies.]

WE have permission to extract the following from the rules issued by the Phœnix Fire Office:—These Rules were the first Electric Light Risk Rules issued, and were prepared by Mr. Musgrave Heaphy, C.E. They are accompanied by remarks by the author, setting out that deviations are allowed under certain circumstances, always provided that the consent of the Company's representative has first been obtained. The first edition of the Rules was published in February, 1882; they have now (January, 1894) reached the twenty-second edition.

RULE 1. Where practicable, all conductors in a building should be so placed as to be easily accessible, and capable of being thoroughly inspected whenever required. It is desirable, therefore, that conductors be not run out of sight, such as between floors and ceilings, under roofs, behind skirting-boards, wainscoting, &c., if it can be avoided.

RULE 2. All conductors to have sufficient sectional area, so as to allow at least 100 per cent. more electricity being safely sent through them than will ever possibly be required for the lights they are to supply. By safety is meant that there shall be no perceptible heating of the conductors to the touch; and when proportioning their sizes, the possibility of their sectional areas getting diminished by corrosion or mechanical injury, as time goes on, should never be forgotten; the importance of this cannot be overrated.

Under normal conditions for internal work, the quantity of current sent down a conductor must not exceed the ratio of 1,000 amperes per sectional square inch of copper, when the amount passing through the said conductor does not exceed 100 amperes; should the amount of current exceed 100 amperes, the ratio must, of course, be less. The conductors should be of copper, the conductivity of which should not be below 98 per cent. The use of copper, however, is not obligatory in all cases. All conductors of a larger sectional area than No. 16 S.W.G. should be composed of strands.

RULE 3. No naked conductor, or conductors, allowed in a building.

RULE 4. All conductors must be highly insulated with substantial coats of india-rubber of the highest quality, and which must be specially prepared to last, and which must be of approved thicknesses (or other specially approved equally good material or materials that will not too readily become plastic, that are impervious to moisture, and of lasting quality); and the insulation should be protected by strong and durable coverings, such as braided hemp, which should also be impervious to moisture. The insulation should be as uninflammable as practicable, so long as its efficiency or durability is not diminished thereby. The outer coat of india-rubber must be vulcanised, or treated in other specially approved manner, but that next the metallic conductor must be pure. The insulation on a conductor should be in the form of a homogeneous tube, and the insulation resistance of the conductor before fixing should not be less than 250 megohms per mile in dry places, and 600 megohms per mile in damp places.

Digitized by Google

RULE 5. In non-hazardous risks, the conductors having been thoroughly well insulated (as described under Rule 4) should be enclosed in substantial wood casing, and the conductors kept apart by a continuous fillet or width of wood; and the fillet or width of wood should be $1\frac{1}{2}$ inches in breadth in the case of mains, 1 inch in breadth in that of the principal branches, and $\frac{1}{2}$ inch in breadth in that of the smallest branches. The casing should be composed of sound, hard, well-seasoned wood, although iron or other approved metal tubes may sometimes be used. There must be no crossing of wires in casing. Where the conductors are permitted to remain unenclosed, the mains should be kept from 4 to 6 inches, and the small branches at least 2 inches apart; and no conductor should be less than 2 inches from any other conductor, or conducting substance, unless special precautions against contact have been taken. Where external injury is possible, the conductors must be enclosed in hard wood, slate or other approved casing, or laid in cement troughing (dry), or securely placed in metal tubes (except under those circumstances where the use of metal tubing would not be desirable), or otherwise efficiently protected.

Where conductors are not enclosed, and when the electromotive force exceeds 220 volts with a continuous current, or 110 volts with an alternating current, the distance they should be kept apart from each other, and from all other conducting substances, ought to be at least 6 inches.

In hazardous risks, all conductors should be further protected. Having been thoroughly well insulated as before described, they might be laid in hard wood casing treated with an approved fire-proof paint or compound, and packed in with asbestos or silicate cotton or other approved material; or they might be laid in cement troughing, or in separate earthenware tubes (or separate metal tubes may be used when alternating currents are not employed). (For theatres and very hazardous risks see Rule 38.)

If the electromotive force exceeds 220 volts with a continuous current, or 110 volts with an alternating one, special precautions, varying according to the electromotive force employed and the surrounding conditions, may be required. Where the current is of extremely high electromotive force, then the conductors may have to be encased and kept apart as described in Rule 29, for the primary conductors carrying alternating currents to secondary generators.

The best rule to follow when laying the conductors, is to so arrange them, that they would still be practically insulated, in the event of their insulating coverings getting worn away, or removed.

RULE 6. Twin wires, where allowed, should be kept as free as possible from the vicinity of inflammable materials, be very carefully protected by cut-outs, their insulation should be as substantial as possible and be protected also as much as possible against abrasion; the wires should not be in positions where they could make an earth. Too much attention cannot be bestowed upon this rule.

RULE 7. All conductors in buildings passing between floors and ceilings, under roofs, behind wainscoting, through partitions, or otherwise out of sight, must, where practicable, be enclosed in wood or earthenware casing, or laid in cement troughing, or in separate earthenware (or approved metal) tubes, in the manner described under Rule 5. No conductor carrying an alternating current of over 110 volts, nor any conductor carrying an alternating current that forms part of a three-wire system, the electromotive force of which between the first and third conductors exceeds 210 volts, should be laid out of sight.

RULE 8. All conductors in a building that are exposed to moisture must have waterproof insulation. All casings, under similar conditions, in or about a building must be made waterproof. A contractor should not be required to do electrical work in a building not thoroughly "dry."

Digitized by Google

RULE 9. External conductors attached to a building must be insulated, and the insulation must be of a waterproof and durable character calculated to resist deterioration from atmospheric influences.

RULE 10. Conductors should never pass through party walls separating two risks. If conductors are carried up lifts, special precautions may in some cases be required.

RULE 11. All conductors passing through the exterior walls of buildings must be insulated and enclosed in separate earthenware (or approved metal) tubes, or laid in a suitable cement, in the manner described under Rule 5. The arrangement must be such as not only to prevent moisture entering, but also fire penetrating from the outside by running along the conductors.

RULE 12. When two conductors are joined together, the junction must be soldered. Rosin should be used when soldering.

RULE 13. Wherever a branch is led off any conductor to supply current for one or more incandescent lamps, or for any other purpose, a short length of lead, tin, or other fusible metal or substance, must be inserted at the junction of the branch with the conductor, or as close thereto as possible, and should be of such section, length, and nature that, if the current passing through it exceeds the normal current by 50 per cent., then it will fuse and disconnect the branch. When the normal current sent down a small wire does not reach half the safe-carrying capacity of the said branch, then the cut-outs may be arranged to fuse at a higher percentage, provided such amount of current does not exceed 100 per cent. of the normal current of the small wire, and that the margin of safety is not lessened thereby. All principal branches, and branches having a considerable number of lights, must have cut-outs on both poles. Small branches, taken off conductors of much larger size, and the branches supplying current to fittings containing several lights, should have cut-outs on both poles. When the current is derived from a central station, or from accumulators, no branch carrying four amperes or upwards should be without cut-outs on both poles. Cut-outs should never be placed under floors, inside roofs, or behind wainscoting, or skirting-boards, or in wood cupboards. They should be so arranged and mounted that no danger could arise in the event of their heating or fusing. If any conductor, by re-uniting with any other conductor, or by any other arrangement, becomes technically part of the main or otherwise, it will still be considered as a branch if its sectional area is less than the conductor it issues from, and must be protected as such. The mains themselves, both positive and negative, must be protected by cut-outs, which should be placed as near the dynamo (or source of electricity) as possible. When lights are grouped, as upon electroliers, &c., care must be taken that the last controlling cut-out shall act before the smallest wire runs any risk of getting unduly heated. When an incandescent installation is arranged on the "multiple circuit" system, with distributing switch and cut-out boards, the ultimate distributing circuits should carry as small an amount of current as possible—not more than from 4 to 5 amperes. With regard to arc circuits, or when incandescent lamps are arranged in series, the question as to whether fusible "cut-outs," or what other kind of "cut-outs," should or should not be used, must be decided as each particular case arises.

RULE 14. The fastenings of conductors should be composed of a non-conducting material. When conductors are not encased, they should be fastened to porcelain or earthenware insulators. Where metal staples are used a piece of some approved insulating should be inserted between the head of the staple and the insulation of the conductor; saddles or wood cleats should, however, be used in preference to metal staples.

RULE 15. No earth return allowed.

Digitized by Google

RULE 16. House mains and all the principal branches when the current is supplied from a central station or from accumulators to have switches on both poles. The arrangement should be such that the current can be entirely cut off from the lights in any portion of the building the occupier may desire. All the principal portions of a building, therefore, should be controlled by double switches. All switches to be of such construction and make that they will not be liable after short use to get out of order and heat or fire. Their construction should also be such that it would be impossible for them to remain in any intermediate position between full-on and off. All switches must be mounted and placed in such a secure manner that no danger can arise in the event of their heating. They must also be so mounted that leakage of electricity from them is rendered impossible. Switches inside buildings must always have an incombustible base, the insulation of which should be perfect. No metal work carrying current should be exposed at the underside of the base. The cover should be incombustible, and they should be kept perfectly free from moisture. Switches contained in lamp sockets will only be allowed where permission to use them has been obtained. Where practicable every room and every passage should be controlled by a separate switch. The current carried by the last controlling switch should not exceed 6 amperes.

RULE 17. A switch and a cut-out on each conductor should be placed outside a building at or near the entrance of the conductors, when the electricity is generated externally. When switches and cut-outs cannot satisfactorily be placed outside a building, they must be fixed inside at the entrance of the conductors into the building, in accessible positions. When the building is in the occupancy of various tenants, each tenant must have a double switch and double cut-outs at the points of entrance of the conductors into his tenancy (preferably on the outside). When the source of supply is internal, a switch and a cut-out should be placed on each conductor in the dynamo-room.

RULE 18. Switch-boards should be composed of a non-conducting fireproof material, and they should be in a dry and secure place, and be most carefully fixed and mounted, and the arrangement of the conductors at the back should, if possible, be such, that if on fire, the fire could not spread to the rest of the installation. It is preferable for switch-boards to be "split," *i.e.*, the positive portion separated from the negative part. All switch-boards should have an oak, teak, or mahogany frame with glass front.

RULE 19. Resistances, bare or other connections, lamps, &c., must be so mounted that no danger could arise in the event of their heating, and that leakage of electricity from them is impossible. Resistances must be mounted on an incombustible material, and kept well away from inflammable materials.

RULE 20. Inflammable materials must be kept at a perfectly safe distance from incandescent lamps, which sometimes get exceedingly hot.

RULE 21. No naked lights allowed. If arc lights are used, they must be furnished with globes, which must be enclosed at the base, and so arranged at the top that no sparks or flame can escape. The globes must be covered round with wire netting. When arc lights are run in series, means must be taken for maintaining the constancy of the current, whatever number of lamps may be burning.

RULE 22. All lamp-holders must be incombustible, and of an approved type. The ends of flexible wire, when composed of fine strands, should be soldered before being attached to holders. All ceiling roses should be composed of an incombustible material, and be most carefully made and fixed. They should be fastened to back blocks. Wall sockets must also be composed of an incombustible material, and the greatest care exercised in fixing them.

Digitized by Google

RULE 23. Electroliers should be fastened to an insulating block, which should be separately fixed to the wall or ceiling. Each electrolier should be protected by cut-outs.

RULE 24. Gas fittings and electric light work should be kept quite distinct from each other. Gas fittings must never be utilised for the electric light, unless specially made for the purpose, and are so arranged that it would be impossible for them to be the means of an "earth" being set up.

RULE 25. Concentric conductors may be used under certain circumstances, but all joints and connections must be so made that freedom from undue heating is absolutely secured; and the outer conductor must be so securely protected that all danger from injury, corrosion or other causes (electrical or otherwise) is effectually prevented, while precautions must be taken to prevent the conductors being affected by moisture.

The insulation resistance between the internal wire and the return of a concentric conductor before being placed up should not be less than 250 megohms per mile; the electromotive force of the current not exceeding 210 volts. The internal wire should be positive, if possible. The insulation must be impervious to moisture, of approved thickness, and have two approved metallic envelopes (the first one forming the return conductor, the second one forming the "guard"); these, except when the system is earthed, must be insulated from each other in such a manner that the internal wire and the return are insulated from each other. The "guard" must be an absolutely efficient protection against mechanical injury taking place to the return conductor, and be also an efficient protection against any accession of moisture to the insulation, especially when the sytem is earthed. The carrying capacity of the conductors must be at least equal to the ratio of that laid down for copper in Rule No. 2; if, however, a metal other than copper be used, the specific resistance of which is greater than that of copper, then the sectional areas of the conductors must be proportionally increased. All switches and cut-outs must be enclosed in approved fireproof boxes. No earth connection will be allowed to a gas pipe, or to lead or compo pipes. If any part of a concentric system be earthed, then the whole system must be concentric: unless permission to the contrary be given. Switches and cut-outs should always act on the internal (or live) wire when the system is earthed. The insulation resistance of the work when placed up must never be below that given in Rule No. 34 for general wiring. When the system is earthed the tests, of course, will refer to the pole that is unearthed.

RULE 26. No dynamo, motor, or any apparatus for generating electricity is to be placed in any working room of any cotton, woollen, flax, jute, or corn mill; or in any mill or factory of a like description; or in any working room or place where any hazardous process is carried on, or in which any hazardous goods are stored, or where there is special risk. The engine-room or mechanics' shop not considered as a "working room." Transformers and accumulators will come under this rule. Wherever a dynamo (or other apparatus for generating electricity) is placed, especial care should be taken to see that the dynamo be thoroughly well insulated from earth. The same rule must be observed with regard to motors and accumulators.

RULE 27. Where accumulators or primary batteries are used, the mains, both positive and negative, must have a switch and a cut-out upon each. The principal branches must also be protected in a similar manner. Accumulators must be kept where there is good ventilation. The conductors from the regulating cells of the accumulators to the regulating switch-board must be protected by cut-outs as close to the regulating cells as possible. It should be possible to turn off the current at the accumulators whenever required. The lug connections of accumulators should be periodically examined.

Digitized by Google

RULE 28. An electrical power installation requires the same safeguards that apply to an electric light installation, in which the conditions of supply and the electromotive force of the current are similar.

RULE 29. When transformers (or secondary generators) are employed, and the alternating primary current is of high electromotive force, neither the transformer nor any portion of the primary work in connection therewith should be placed inside any building, but in a fireproof chamber apart. If this cannot conveniently be done, then the fireproof chamber may be placed inside the building, preferably against an external wall, so that the primary conductors may enter direct and not traverse any portion of the building.

The primary conductors must be heavily insulated with pure and vulcanised indiarubber of the highest quality, specially prepared to last (or other approved material), and must have a very strong external covering, and a very high insulation resistance. The conductors must be kept at a distance of 6 to 12 inches from each other, and be enclosed in separate casings of a non-conducting material, waterproof and fireproof, and these casings channelled into the brick or stone walls of the building; and the arrangement must be such that no leakage of electricity can take place to earth from either of the conductors, or any short circuit from one to the other. The primary conductors must be furnished with an interlocked double-pole switch, and also with a cut-out on both the lead and return, which will act at or below 25 per cent. above the normal current. The switch and cut-outs should be of such design and make that an arc in either of them could not be sustained—they should be placed as close as possible to the entrance of the primary conductors into the fireproof chamber. When permission has been given for primary conductors to enter a building before reaching the fireproof chamber, then the switch and cut-outs should be enclosed in fireproof boxes and placed in accessible and secure positions outside of the building; if they cannot be placed outside, then they must be situated in approved positions close to the entry of the primary conductors into the building. Switches must be so placed as to be readily accessible, in order that the primary current can at once be turned off. The whole of the primary work should be so situated and protected that it could not be tampered or interfered with by unauthorised persons, and the arrangements be such that no damage would result to the building if any portion heated or fired. This Rule insists that too much attention cannot be bestowed with regard to the placing of all portions of the primary work and the rendering of them safe and reliable. A transformer should be so constructed that a leak between the primary and secondary coils is rendered impossible, or for the primary current to pass into the secondary conductors; all secondary work must be protected by an approved automatic apparatus (or arrangement) at or near the transformer, so that in the event of the difference of potential between either secondary conductor and the earth rising at any time above 400 volts, then the apparatus will instantly act and cut off the current. The secondary work in the house should also be protected by an approved device, so arranged that in the event of the resistance to earth of any circuit falling below 1,000 ohms, then it would instantly act and cause the primary current to be at once cut off from the building. The primary current entering a house transformer ought never to exceed 2,500 volts. If, however, the current be generated higher than this, and reduced by means of transformers, then at each transformer, intermediate between the house transformer and the generating dynamo, there must be placed an approved automatic apparatus (or device) whereby the conductors leading from each transformer in the direction of the building to be supplied with current cannot possibly have their electromotive force raised more than 20 per cent. above the normal.

The secondary conductors must be highly insulated with at least two coats of indiarubber of the highest quality (the outer one must be vulcanised), of

Digitized by Google

specially approved character, make, and thicknesses, and specially prepared to last, and they must have a very strong external waterproof covering; they should be furnished with switches and cut-outs on both poles, except in the case of small branches, when single switches and single cut-outs may be used. Where the secondary conductors pass out of the transformer house they should do so separately, in earthenware or other fireproof tubes or casings.

RULE 30. When the "multiple parallel" (or "multiple series") system is intended to be used in any building, the insulation of the conductors should be of the highest possible character, similar to that described in Rule 29, for the primary conductors when transformers are used; and all work should be of the very best possible description, and on the surface where practicable. Every parallel (or series) must have an efficient automatic "protector" of such make and design that if the difference of potential of that parallel should rise to 25 per cent. above the normal from any cause whatsoever, then the protector will instantly bring back the potential to the normal, or else cut out the parallel (or series). Means must also be adopted in the dynamo room for maintaining the constancy of the current whatever number of lamps may be burning. A main switch must be placed in a fireproof box in a secure and accessible position outside the buildings when the electricity is generated externally; when the source is internal then it must be situated in the dynamo room (any place wherein the electricity is generated). Efficient precautions must be taken to prevent earthing of the conductors either inside or outside the premises.

RULE 31. When a building is supplied with current upon the three-wire system, the electro-motive force of the current in the building will be considered from a fire point of view equivalent to that existing between the first and last conductors of the series. If the system has more than three wires, the electro-motive force of the current will be considered as depending upon the particular wires of the series brought in, and their relation to the outer ones of the series.

RULE 32. When electricity is supplied from a central station, each conductor therefrom must be provided at their points of entrance into the premises with a switch and cut-out, which should be outside the building or buildings if possible. If these switches and cut-outs cannot satisfactorily be placed outside, they must be fixed inside at the entrance of the conductors into the building, and the conductors must be brought inside in as secure a manner to accessible points, where the switches and cut-outs may be securely placed. The importance is insisted upon of taking all precautions with regard to the prevention of fire when placing in the service lines, and coupling them up to the house wiring. The cut-outs should act at or below 50 per cent. above the normal current, and both the cut-outs and switches should be effectually protected against moisture. When the service lines are brought into buildings containing inflammable goods, or where there is any special risk, the service lines, main cut-outs, and the meter should be all enclosed in a fire-proof chamber, out of which the house mains should pass in approved fire-proof tubes. (This rule is intended to apply to systems not covered by Rule 30.) The occupier should be able to turn off the electricity entirely from his premises whenever he considers it necessary. The switches should be of quick and wide break type.

RULE 33. When high-tension currents are used from a central station (or other place) to charge accumulators, and secondary house circuits having a current of lower potential than that of the primary circuit are taken from the accumulators, then the secondary conductors should be provided with a device or arrangement by means of which their connection with the accumulators during the time these latter were being charged would be prevented. A current having an electro-motive force of 500 volts or upwards will be considered as a high-tension current for this purpose.

Digitized by Google

RULE 34. In any electric light installation in which the current is continuous and has an electromotive force of 220 volts or under, the insulation resistance over the whole installation should not be below the following:—

Installations of	25	Lights	500,000 Ohms.
,,	50	,,	250,000 ,,
,,	100	,,	125,000 ,,
,,	500	,,	25,000 ,,
,,	1,000	,,	12,500 ,,

When the lights are proportionate between the above numbers, then the insulation resistance should be correspondingly proportionate. The insulation resistance of the separate circuits of the installation should also be taken, and should be in accordance with the above table.

For alternating currents the minimum insulation resistance must be twice the above number of ohms respectively. Under normal conditions the fall of potential in the conductors in a building should not exceed two volts at the farthest point of any circuit when all the lamps are alight.

An isolated installation should contain an automatic device that would give a warning if a leak were set up to earth in any portion of the premises.

RULE 35. Wherever electricity is supplied from a central station, accurate insulation tests should be made at least once daily over the whole system. This is especially essential where transformers are employed, or when the multiple parallel (or multiple series) system is used.

RULE 36. All conductors from a central station entering, or connected to, or traversing any building or buildings, should have an arrangement of lightning dischargers. Overhead conductors, supported by poles on roofs, will be considered as being connected to those buildings on which the poles are situated. In private installations where the electricity is generated at a distance, the carrying mains should have lightning dischargers.

RULE 37. Special precautions may be required to be taken with regard to electrical work in the case of warehouses and hazardous risks.

RULE 38. In very hazardous risks, special precautions may have to be taken, such precautions necessarily varying according to the peculiarity of the circumstances of the hazard. For instance, with regard to theatres, the work should be of a special character—the work in connection with batten, wing and float lights should be incombustible if possible, the switch board incombustible, and arranged with the view of the minimum amount of danger arising if a fire broke out about it; the work in connection with floor plugs, or temporary attachments, should be special, great care being taken to prevent any liability of heating being set up in them from bad contacts or other causes; fixed conductors on the stage should be in oak, or other specially approved casings; any loose conductors should have very strong coverings to their insulation; all lights must be at a safe distance from all inflammable materials; and all work specially protected against liability to injury. In paper mills, the greatest precautions must be taken against damp and corrosive vapours or gases. Very special precautions have to be taken in sugar mills, and in certain saw mills, and in some places it may not be advisable to put up electrical work. Where naphtha or certain chemicals are used, a solvent action may be set up on the insulation, or the chemicals employed may act upon the electrical work and slowly or quickly eat it away; the conditions may, in fact, be such that it would not be advisable to place up electrical work.

RULE 39. The same general safeguards must be taken for electrical heating and cooking as for lighting. Conductors employed for supplying current for electrical cooking or heating should never be attached to a lamp socket, but to proper terminals of a circuit, the conductors of which have a large carrying capacity, each conductor must have a switch and cut-out.

Digitized by Google

RULE 40. All work to be accurately tested at the time of erection for insulation and conductivity, and all installations should be periodically examined and tested.

RULE 41. Before the electrical installation is used, notice should be sent to the insuring office, in order that an opportunity may be given for the installation to be inspected with regard to its fire risk. Full particulars of the proposed installation and all its details should be supplied. The particulars must include a statement of the maximum current to be sent down the various conductors, and the electromotive force of the current; also whether the current is to be direct or alternating, and whether generated on the premises or supplied from a central station. Samples of the conductors must be sent, that they may be examined. Specimens of the cut-outs, protectors, switches, and ceiling roses may be required should the description of them be obscure or unsatisfactory. It is advisable that these particulars be sent before the work of installation is commenced.

The Phœnix "Rules" also contain a set of what are termed "Useful Facts" for the guidance of electrical contractors and their clients.

The following are the Rules and Regulations for the Prevention of Fire Risks arising from Electric Lighting issued by the INSTITUTION OF ELECTRICAL ENGINEERS of London. They are revised and remodelled from the Rules issued by the Society of Telegraph Engineers in 1883, and from other sources of information, both home and foreign, and recommended by the Council in accordance with the Report of the Committee appointed by them to consider the subject.

These general rules are not intended to supersede any detailed rules which fire offices may issue for their own protection, and it is desirable that before the electric light is used, notice should be sent to the fire office in which the building is insured, in order that an opportunity may be given for inspecting the installation. The chief difficulties which beset the electrical engineer are internal and invisible, and they can only be effectually guarded against by testing with special apparatus and electric currents; they arise from leakage and from bad connections and joints, which lead to waste of energy and the production of heat to a dangerous extent. The necessity cannot be too strongly urged for guarding against the presence of moisture, which leads to loss of current and to the destruction of the conductors and apparatus by corrosion and otherwise. Injudicious connections of any part of the circuit with the "earth" tend to magnify every other source of difficulty and danger. Many of the dangers in the application of electricity arise from ignorance and inexperience on the part of those who supply and fit up inadequate plant, and frequently from injudicious economy on the part of the user. The greatest element of safety is, therefore, the employment of skilled and experienced electrical engineers to specify the method in which the work is to be done and the quality of the materials to be employed, and to supervise the execution of the work.

RULE 1. Conductors must have a sectional area and conductivity so proportioned to the work they have to do that, if double the current proposed is sent through them, the temperature of such conductors shall not exceed 150° F.

2. The conductors, or their casings, should be placed in sight if possible; and they should always be as accessible as circumstances will permit.

3. Within buildings they should all be insulated; and this rule applies equally to all conductors and parts of fittings which may have to be handled.

4. Whatever insulating material is employed, it should not soften until a temperature of 170° F. has been reached, and in all cases the material must be damp-proof.

Digitized by Google

5. When leads pass through roofs, floors, walls, or partitions, and where they cross or are liable to touch metallic substances, such as bell wires, iron girders, or pipes, they should be thoroughly protected by suitable additional covering; and where they are liable to abrasion from any cause, or to the depredations of rats or mice, they should be encased in some suitable hard material.

6. In the case of portable fittings with which flexible leads are used special precautions must be taken.

7. Conductors should be kept as far apart as circumstances will permit, the spacing between them being governed by their potential difference.

8. When conductors are carried in very inflammable structures, precautions should be taken to isolate them therefrom.

9. Conductors which are protected on the outside by lead, or metallic armour of any kind, require the greatest care in fixing, on account of the large conducting surface which would become connected to the core in the event of metallic contact between them.

10. In cases where conductors pass into a building, from one building to another, or from one room to another, precautions should be taken to prevent the possibility of fire or water passing along the course of the conductors.

11. All joints must be mechanically and electrically perfect, to prevent heat being generated at these points. When soldering fluids are used in making joints, the latter should be carefully washed and dried before insulation is applied.

12. Under all circumstances complete metallic circuits must be employed. Gas and water pipes must never form part of the circuit, as their joints are rarely electrically good, and therefore become a source of danger.

13. Overhead conductors, whether passing over or attached to buildings, must be insulated at their points of support. Precautions must be taken to obviate all risk of short-circuiting where they are likely to touch a building or other overhead conductors and wires, either by their own falling, or by being fallen upon by other conductors.

14. In the case of overhead wires, every main should have a lightning protector at each point where it enters or branches into a building.

15. Metal fastenings for fixing conductors should be avoided; but, when unavoidable, some additional covering should protect the conductor from mechanical injury at such fixing points.

16. The insulation of a system of distribution should be such that the greatest leakage from any conductor to earth (and, in case of parallel working, from one conductor to the other, when all branches are switched on, but the lamps, motors, &c., removed), does not exceed one five-thousandth part of the total current intended for the supply of the said lamps, motors, &c., the test being made at the usual working electromotive force.

17. It will often be found a great convenience and assistance in the prevention of accidents if the positive lead be coloured differently to the negative, or made otherwise distinguishable.

18. Every switch or commutator should be of such construction as to comply with the following condition, namely:—That when the handle is moved or turned to and from the positions of "on" and "off," it is impossible for it to remain in any intermediate position, or to permit of a permanent arc, or heating.

19. The handles of every switch must be completely insulated from the circuit.

Digitized by Google

20. The main switches of a building should be placed as near as possible to the point of entrance of the conductors, or to the generators of the current if they are within the building itself. Switches should be provided on both leads.

21. Switch-boards should bear clear instructions for their use by the inexperienced.

22. Switches, commutators, resistances, bare connections, lamps, &c., must be mounted on incombustible bases. Cut-outs mounted on bases of wood rendered uninflammable are admissible. Vulcanite bases are undesirable in damp situations. The cracking of porcelain and earthenware fittings is a source of danger which can be avoided by precautions in fixing.

23. All circuits should be protected with cut-outs; and all leads from the mains, or small conductors from larger ones, must be fitted with cut-outs at their branching points.

24. Where fusible cut-outs are used, the section should be so situated within its frame that the fused metal cannot fall where it may cause a "short-circuit" or an ignition.

25. For all main conductors a cut-out should be provided for both the "flow" and "return," and the two fusible sections must not be in the same compartment.

26. The flexible leads of portable fittings must in all cases be protected by cut-outs at their fixed points of connection.

27. Arc lamps must always be guarded by lanterns or netted globes, so as to prevent danger from ascending sparks and from falling glass and incandescent pieces of carbon.

28. All parts of the lamps and lanterns which are liable to be handled (except by the persons employed to trim them) should be insulated.

29. The armatures and field-magnet coils should be thoroughly insulated. Dynamos should always be fixed in dry places, and they must not be exposed to dust flyings or other industrial waste products carried in suspension in the air. They should not be permitted in the working-rooms of mills, where the liability to such dangers exists, or where any inflammable manufactures are carried on or inflammable materials are stored.

30. Motors should be subject to the same conditions; but when it is necessary to use them in positions such as those above referred to, they must be securely cased in, such cases having a non-combustible lining.

31. Both primary and secondary batteries should be placed and used under the same precautions as prescribed for dynamos; and the room in which they are placed should be well ventilated. The batteries themselves must be well insulated.

32. When these are used to transform either direct or alternating currents of high electromotive force—that is, from or to an electromotive force of, say, 200 volts—they, together with their switches and cut-outs, must be placed in a fire and moisture proof structure—preferably outside the building for which they are required. No part of such apparatus should be accessible except to the person in charge of their maintenance.

33. In all cases conductors conveying currents of high electromotive force inside buildings must be specially and exceptionally insulated, cased in, and the casing made fireproof.

34. The positive and negative terminals connected to such conductors should not be permitted to be nearer each other than twelve inches.

35. Transformers which, under normal conditions of load, heat above 150° F., should not be permitted to remain in use.

Digitized by Google

36. Transformers should be so constructed that under no circumstances whatever should a contact between the primary and secondary coils lead the high E.M.F. into the building.

37. The value of frequently testing and inspecting the apparatus and circuits cannot be too strongly urged as a precaution against fire. Records should be kept of all tests, so that any gradual deterioration of the system may be detected.

38. Cleanliness of all parts of the apparatus and fittings is essential to good maintenance.

39. No repairs or alterations must be made when the current is "on."

All the above rules, for the reduction to a minimum of the risks from fire, are also applicable in principle to installations of electricity for other uses than that of lighting; they also include precautions necessary to avoid risk of injury to persons, whether the conductors and apparatus are situated inside or outside a building.

With regard to the Fire Risk Rules which regulate the policies of other British Fire Offices, owing largely to the efforts made by Mr. M. H. Pryor, the managing director of the Sun Office, with the assistance of Mr. Human, of the Guardian, and others, the following sets of Rules have been agreed upon by about 25 of the leading offices. Slight modifications in the "Conditions" are noticeable in some of the Rules of which we have received copies, and the Table of Conductors varies slightly. The Tables (A) and (B) given herewith are those issued by the Guardian Office; (A) is based upon Mr. A. E. Kennelly's Tables of Limiting Current, and the fuse wires from Mr. Preece's Table, the latter of which will be found on a subsequent page of this DIRECTORY AND HANDBOOK, as will also a more detailed Fuse Table and Diagram compiled by Mr. Clarence Feldmann. The chief modification in the Rules now agreed upon, and those previously issued, is in the increase in the standard of conductivity and insulation, and in the more general recognition of concentric wiring, under certain restrictions.

Among the leading Companies by whom these Rules are issued may be mentioned the Guardian, Sun, North British and Mercantile, Liverpool and London and Globe, Alliance, London Assurance Corporation, Hand-in-Hand, Westminster, Royal Exchange, &c., &c.; and risks are undertaken by these Companies under the Rules without extra premium.

The following introduces the Rules:—

The Principal Sources of Danger are:

1. Inferior materials and workmanship, particularly in joints, fittings and connections.
2. Conductors of inadequate size and conductivity.
3. Perishable and inferior insulating material.
4. Dust, dirt and moisture.
5. Undue heating.
6. Neglect of frequent testing and inspection.

No installation can be accepted in which all these are not adequately provided against. The employment of competent engineers, to prepare specifications for, and to superintend, and of responsible firms to carry out all installations is most strongly to be urged.

Notice of the introduction or extension of electric lighting plant must in all cases be given to the Fire Office, and any alteration in the details should likewise be notified.

The following rules are generally applicable. If deviations should be found necessary in special cases, they must be subject to the approval of the Fire Office.

Digitized by Google

RULES.

I. SOURCES OF ELECTRICITY.—(A) No machinery for generating electricity must be placed in any room in which inflammable material is manipulated, or in which easily inflammable material is stored, or which has openings into any room in which inflammable material is manipulated, or in which any processes causing dust or flyings are carried on.

(B) Dynamos must not be placed within 12 inches of any unprotected combustible material other than their seating; they must be insulated as far as possible, and must be fixed in a dry place, free from dust and as cool as practicable.

(C) Dynamos must be marked with their maximum capacity in volts and amperes, and also with their maximum safe speed, which must under no circumstances be exceeded. Voltmeters, ammeters and speed indicators should be fitted, and if the apparatus is not completely self-regulating a competent person must be constantly in attendance.

II.—Primary and secondary batteries must be set in a dry place free from dust, and well ventilated. They must be insulated. Incandescent lamps only must be used in battery rooms.

III. CONDUCTORS.—(A) Conductors (except in the case of the concentric system of wiring) must be of copper, of a conductivity not less than 98 per cent. of that of pure copper.

(B) Conductors must be so proportioned to the amount of current to be carried by them, that in no case shall the temperature of the conductor exceed 18°F. or 10°C. above the surrounding air. (*See* Table A.)

(C) Conductors must at no point be exposed to a temperature exceeding 140°F.

NOTE.—Subject to special sanction, bare conductors may be used in the concentric system, and also in lofty buildings in positions only accessible to authorised persons, if carried upon suitable insulators and exposed to view.

TABLE A.

The insulation of a system of distribution shall be such that the leakage to earth (and from conductor to conductor in parallel working) shall not exceed *one twenty-thousandth* part of the total current at full working load.

RULE 16. House mains and all the principal branches when the current is supplied from a central station or from accumulators to have switches on both poles. The arrangement should be such that the current can be entirely cut off from the lights in any portion of the building the occupier may desire. All the principal portions of a building, therefore, should be controlled by double switches. All switches to be of such construction and make that they will not be liable after short use to get out of order and heat or fire. Their construction should also be such that it would be impossible for them to remain in any intermediate position between full-on and off. All switches must be mounted and placed in such a secure manner that no danger can arise in the event of their heating. They must also be so mounted that leakage of electricity from them is rendered impossible. Switches inside buildings must always have an incombustible base, the insulation of which should be perfect. No metal work carrying current should be exposed at the underside of the base. The cover should be incombustible, and they should be kept perfectly free from moisture. Switches contained in lamp sockets will only be allowed where permission to use them has been obtained. Where practicable every room and every passage should be controlled by a separate switch. The current carried by the last controlling switch should not exceed 6 amperes.

RULE 17. A switch and a cut-out on each conductor should be placed outside a building at or near the entrance of the conductors, when the electricity is generated externally. When switches and cut-outs cannot satisfactorily be placed outside a building, they must be fixed inside at the entrance of the conductors into the building, in accessible positions. When the building is in the occupancy of various tenants, each tenant must have a double switch and double cut-outs at the points of entrance of the conductors into his tenancy (preferably on the outside). When the source of supply is internal, a switch and a cut-out should be placed on each conductor in the dynamo-room.

RULE 18. Switch-boards should be composed of a non-conducting fireproof material, and they should be in a dry and secure place, and be most carefully fixed and mounted, and the arrangement of the conductors at the back should, if possible, be such, that if on fire, the fire could not spread to the rest of the installation. It is preferable for switch-boards to be "split," *i.e.*, the positive portion separated from the negative part. All switch-boards should have an oak, teak, or mahogany frame with glass front.

RULE 19. Resistances, bare or other connections, lamps, &c., must be so mounted that no danger could arise in the event of their heating, and that leakage of electricity from them is impossible. Resistances must be mounted on an incombustible material, and kept well away from inflammable materials.

RULE 20. Inflammable materials must be kept at a perfectly safe distance from incandescent lamps, which sometimes get exceedingly hot.

RULE 21. No naked lights allowed. If arc lights are used, they must be furnished with globes, which must be enclosed at the base, and so arranged at the top that no sparks or flame can escape. The globes must be covered round with wire netting. When arc lights are run in series, means must be taken for maintaining the constancy of the current, whatever number of lamps may be burning.

RULE 22. All lamp-holders must be incombustible, and of an approved type. The ends of flexible wire, when composed of fine strands, should be soldered before being attached to holders. All ceiling roses should be composed of an incombustible material, and be most carefully made and fixed. They should be fastened to back blocks. Wall sockets must also be composed of an incombustible material, and the greatest care exercised in fixing them.

Digitized by Google

RULE 23. Electroliers should be fastened to an insulating block, which should be separately fixed to the wall or ceiling. Each electrolier should be protected by cut-outs.

RULE 24. Gas fittings and electric light work should be kept quite distinct from each other. Gas fittings must never be utilised for the electric light, unless specially made for the purpose, and are so arranged that it would be impossible for them to be the means of an "earth" being set up.

RULE 25. Concentric conductors may be used under certain circumstances, but all joints and connections must be so made that freedom from undue heating is absolutely secured; and the outer conductor must be so securely protected that all danger from injury, corrosion or other causes (electrical or otherwise) is effectually prevented, while precautions must be taken to prevent the conductors being affected by moisture.

The insulation resistance between the internal wire and the return of a concentric conductor before being placed up should not be less than 250 megohms per mile; the electromotive force of the current not exceeding 210 volts. The internal wire should be positive, if possible. The insulation must be impervious to moisture, of approved thickness, and have two approved metallic envelopes (the first one forming the return conductor, the second one forming the "guard"); these, except when the system is earthed, must be insulated from each other in such a manner that the internal wire and the return are insulated from each other. The "guard" must be an absolutely efficient protection against mechanical injury taking place to the return conductor, and be also an efficient protection against any accession of moisture to the insulation, especially when the sytem is earthed. The carrying capacity of the conductors must be at least equal to the ratio of that laid down for copper in Rule No. 2; if, however, a metal other than copper be used, the specific resistance of which is greater than that of copper, then the sectional areas of the conductors must be proportionally increased. All switches and cut-outs must be enclosed in approved fireproof boxes. No earth connection will be allowed to a gas pipe, or to lead or compo pipes. If any part of a concentric system be earthed, then the whole system must be concentric: unless permission to the contrary be given. Switches and cut-outs should always act on the internal (or live) wire when the system is earthed. The insulation resistance of the work when placed up must never be below that given in Rule No. 34 for general wiring. When the system is earthed the tests, of course, will refer to the pole that is unearthed.

RULE 26. No dynamo, motor, or any apparatus for generating electricity is to be placed in any working room of any cotton, woollen, flax, jute, or corn mill; or in any mill or factory of a like description; or in any working room or place where any hazardous process is carried on, or in which any hazardous goods are stored, or where there is special risk. The engine-room or mechanics' shop not considered as a "working room." Transformers and accumulators will come under this rule. Wherever a dynamo (or other apparatus for generating electricity) is placed, especial care should be taken to see that the dynamo be thoroughly well insulated from earth. The same rule must be observed with regard to motors and accumulators.

RULE 27. Where accumulators or primary batteries are used, the mains, both positive and negative, must have a switch and a cut-out upon each. The principal branches must also be protected in a similar manner. Accumulators must be kept where there is good ventilation. The conductors from the regulating cells of the accumulators to the regulating switch-board must be protected by cut-outs as close to the regulating cells as possible. It should be possible to turn off the current at the accumulators whenever required. The lug connections of accumulators should be periodically examined.

Digitized by Google

IV.—(A) Conductors (except as below) must be protected throughout with durable coverings affording

1. Adequate electrical insulation.
2. Adequate protection from injury.
3. Permanent and complete exclusion of moisture.

(B) Such coverings must consist respectively of—

1. India-rubber, or other approved insulating material or materials of sufficient thickness, not softening so as to allow of its being displaced at a temperature below 160° F., nor easily inflammable.
2. Braiding or tape.
3. Coatings of varnish, or other suitable waterproofing composition.

(C) The resistance of the insulation of conductors at 60° F. must in no case be less than 300 megohms per statute mile.

(D) Metal sheathing may be used to provide special protection from moisture, or from injury by vermin or abrasion, but the greatest care is required to avoid contact between the actual conductor and the sheathing, also between the sheathing and any other conducting body.

(E) In all installations where the concentric or other approved special system of wiring is adopted, the work must be carried out, not only subject to these regulations as far as applicable, but also in accordance with such authorised rules as may be issued in respect of such system.

V.—Twin wires, and wires with an inner coating of india-rubber, covered with silk or cotton, should only be used for flexible leads to movable and pendant lamps.

VI.—(A) All conductors must be cased throughout, except as before-mentioned; where permitted without such casing their attachments must be such as to prevent sagging.

(B) Casings must have a continuous central rib separating the conductors, which rib must exceed in width the diameter of the grooves carrying the conductors, and in no case be less than $\frac{3}{8}$ inch. Care must be taken that this rib is not injured by screws and nails, which must on no account penetrate into the grooves.

(C) "Bunching" of conductors can only be allowed where no material difference of potential exists between contiguous wires.

VII.—Conductors or their casings should be in sight, and must be as accessible as circumstances admit.

VIII.—(A) Conductors passing through party or division walls must be placed in separate tubes or channels of stoneware, or other incombustible material, set in cement. Care must be taken to prevent the possibility of fire or water passing through the apertures, and of injury to the insulation by the cement or other substances used. Conductors carried through partitions, through or under floors or roofs, and wherever they are concealed from view, must, if not cased, be kept at least six inches apart, and so arranged as to minimise the risk of injury.

(B) Conductors exposed to injury from vapour, water, vermin, or other causes, as in battery rooms, must be provided with suitable additional protection beyond that specified in Rule IV. Stoneware tubes or channels are the safest protection, but care must be taken to prevent the entry of moisture. Bare conductors are in some cases the safest.

(C) The possibility of water running along conductors, or between any conductor and any other conductor or conducting body whatever, must be effectually guarded against. Where conductors pass near other conductors and metallic or other bodies capable of conducting electricity, such as pipes, every precaution must be taken to prevent contact therewith.

Digitized by Google

IX.—Metal staples must not be used for fixing conductors.

X.—No gas or water pipes must form part of a circuit, and no direct earth connection can be permitted, except in concentric wiring.

XI.—(A) Neither the leakage of electricity to earth from the whole of any installation, nor the leakage from the supply conductor to the return conductor when all branches are switched on but the lamps, motors, &c., removed, must exceed $\frac{1}{20000}$ part of the total working current, even when tests are made under the most unfavourable conditions of dampness. Under dry conditions double this insulation resistance must be insisted on.

(B) All tests must be made at the E.M.F. intended to be used, but in no case less than 100 volts.

XII.—(A) All joints must be carefully made, spliced and soldered, and insulated; the insulation of the joint being made equal to that of the cable. Resin should be used as a flux, but if soldering fluids are used the joint must be thoroughly washed and dried before the insulating material is applied.

(B) Conductors should be constructed with as few joints as possible, and all connections with fittings and appliances must be securely made and have full electrical contact.

The Board of Trade Rule No. 26 provides that "Overhead conductors shall not in any part thereof be within 7 feet of any building or erection other than a support for the conductor, except where brought into a building for the purpose of supply."

XIII. ARC LIGHTS.—(A) Arc lamps must be properly guarded by lanterns netted globes, or other means. They must be so constructed as to prevent the escape of hot carbon and sparks.

(B) Arc lamps in parallel with their choking or resistance coils (*see* Rule XVIII.) must each be protected by a fusible cut-out.

XIV. FITTINGS.—(A) All fittings for incandescent lamps, except in the case of concentric wiring, must be insulated as far as practicable at their bases, and the conductors protected from injury by abrasion. No part of any mounting must be used to carry current.

(B) Gas fittings must in no case be used to carry electric lights without special sanction. Such sanction will only be given subject to the wiring being carried out with extra precautions, especially where the supply of electricity is derived from a source of high E.M.F.

XV. SWITCHES.—(A) Switches must have incombustible mountings. They must have rubbing surfaces of ample size; must work from "on" to "off" with a sharp break, and be incapable of producing a permanent arc.

(B) Switch handles, and all fittings intended to be handled, must be properly insulated.

(C) Switch-boards must bear clear instructions as to their use.

XVI.—Controlling switches must be placed in both main conductors, in an accessible position, as near the source of supply as possible.

XVII. CUT-OUTS.—(A) Cut-outs must be placed in positions where they are exposed to view and easily accessible, and not under floors or behind skirtings, and precautions must be taken to prevent their being tampered with or made inoperative.

(B) Cut-outs must have incombustible mountings, and be so constructed that the fused metal cannot cause a short circuit. Covers should be fitted.

(C) Cut-outs must be placed in both main leads, between the source of the supply and the controlling switch.

(D) Cut-outs must be placed on every branch where it is led off from a main conductor, and on every sub-station of a branch conductor intended to carry

Digitized by Google

8 amperes, or upwards. They must be as close to the junction as practicable, and must be so made as to act before any wire in the circuits controlled is heated 18° F. above the surrounding air. In general, cut-outs should be arranged to break circuit when an excess of 50 per cent. over the usual working current has been reached.

(E) Flexible leads and pendant fittings must be provided with cut-outs at their fixed points of connection.

(F) Fusible cut-outs must have the distance between their terminals proportionate to the E.M.F. in no case less than 1 inch.

(G) Where the system employed does not allow of fusible cut-outs, effective automatic safety cut-outs must be substituted.

NOTE.—In the case of arc lights in series, cut-outs may be dispensed with, provided that the dimensions and insulation of the conductors be adequate, the regulating mechanism of the lamps efficient, and proper precautions taken in other respects.

XVIII. RESISTANCE COILS.—Resistance coils must be securely fixed on incombustible mountings, and not placed within 12 inches of any combustible material unless such material is sufficiently protected.

XIX. MOTORS.—Where electro-motors are employed, the same care must be taken as with dynamos, and all their connections must be arranged in conformity with these Rules. When used where inflammable material is manipulated or stored, they must be furnished with incombustible cases, and danger from sparking carefully guarded against.

XX. TRANSFORMERS.—Both alternating and battery transformers should be placed outside the building; but if this is impracticable, then as near the point of entry of the primary conductors as possible, and they must be so fitted that damage cannot occur in the event of a leakage of the high-tension primary current into the secondary circuit. The whole of the high-pressure conductors and apparatus connected therewith must be completely enclosed in solid walls or in strong fire-proof metal casing, efficiently connected to earth, and accessible to none but authorised persons.

XXI. ALTERNATING CURRENTS.—Switches and cut-outs must be fitted to operate on both terminals of all circuits used with alternating currents. None but the best materials and workmanship throughout will be allowed where alternating currents are in use.

The Royal Insurance Company issue no printed regulations, the Company's Surveyor reporting upon each case; and the London and Lancashire is amongst those Companies which adopt the Phœnix Rules.

AMERICAN ELECTRIC LIGHTING FIRE RISK RULES.

The following is an *abstract* of the Rules and Requirements of the Underwriters' International Electric Association of the United States for the installation of wiring and apparatus for electric light and power. It may be mentioned that early in 1894 it is proposed to hold a Conference in America, at which will be discussed a set of Electric Fire Risk Rules having universal application throughout the United States:—

CENTRAL STATIONS.

[These Rules also apply to Dynamo Rooms in Isolated Plants, connected with or detached from buildings used for other purposes; also to all varieties of apparatus therein of both high and low potential.]

Generators must be located in a dry place; must be insulated on floors or base frames which must be kept filled, to prevent absorption of moisture, and also kept clean and dry; must never be placed in a room where any hazardous process is

Digitized by Google

carried on, nor in places where they would be exposed to inflammable gases, or flyings, or combustible material; and must each be provided with a waterproof covering.

From generators, switch boards, rheostats, or other instruments, and thence to outside lines, conductors must be in plain sight and readily accessible; must be wholly on non-combustible insulators, such as glass or porcelain; must be separated from contact with floors, partitions or walls, through which they may pass, by non-combustible insulating tubes, such as glass or porcelain; must be kept rigidly so far apart that they cannot come in contact; must be covered with non-inflammable insulating material sufficient to prevent accidental contact, except that "bus bars" may be made of bare metal and must have ample carrying capacity, to prevent heating.

Switchboards must be so placed as to reduce to a minimum the danger of communicating fire to adjacent combustible material; must be accessible from all sides when the connections are on the back; or may be placed against a brick or stone wall when the wiring is entirely on the face; must be kept free from moisture; must be made of non-combustible material, or of hard wood in skeleton form, filled to prevent absorption of moisture; bus bars must be equipped in accordance with the Rule for placing conductors.

Resistance Boxes and Equalizers must be equipped with metal, or other non-combustible frames; must be placed on the switchboard, or, if not thereon, at a distance of a foot from combustible material, or separated therefrom by a non-inflammable, non-absorptive, insulating material.

Lightning arresters must be attached to each side of every overhead circuit connected with the station; must be mounted on non-combustible bases in plain sight on the switchboard, or in an equally accessible place, away from combustible material; must be connected with at least two "earths" by separate wires, not smaller than No. 6 B. & S., which must not be connected to any pipe within the building; must be so constructed as not to maintain an arc after the discharge has passed.

Testing.—All series and alternating circuits must be tested every two hours while in operation, to discover any leakage to earth, abnormal in view of the potential and method of operation; all multiple arc low potential systems (300 volts or less) must be provided with an indicating or detecting device, readily attachable, to afford easy means of testing where the station operates continuously; data obtained from all tests must be preserved for examination.

Motors must be wired under the same precautions as with a current of the same volume and potential for lighting. The motor and resistance-box must be protected by a double pole cut-out and controlled by a double pole switch; must be thoroughly insulated, mounted on filled dry wood, be raised at least eight inches above the surrounding floor, be provided with pans to prevent oil from soaking into the floor and must be kept clean; they must be covered with a waterproof cover when not in use, and, if deemed necessary, be enclosed in an approved case.

Resistance Boxes must be equipped with metal or other non-combustible frames, and must be placed on the switchboard, or at a distance of a foot from combustible material, or separated therefrom by a non-inflammable, non-absorptive, insulating material.

ARC (SERIES) SYSTEMS (OVER 300 VOLTS).

All outside, overhead conductors (including services) must be covered with some approved insulating material,* not easily abraded, firmly secured to properly

* Insulation that will be approved for service wires must be solid, at least $\frac{3}{64}$ of an inch in thickness, and covered with a substantial braid. It must not readily carry fire, must show an insulating resistance of one megohm per mile after two weeks submersion in water at 70 degrees Fahrenheit, and three days submersion in lime water, with a current of 550 volts and after three minutes electrification.

Digitized by Google

insulated and substantially built supports, all tie wires having an insulation equal to that of the conductors they confine. Outside conductors must be so placed that moisture cannot form a cross-connection between them, not less than a foot apart, and not in contact with any substance other than their insulating supports; they must be at least seven feet above the highest point of flat roofs, and at least one foot above the ridge of pitched roofs over which they pass or to which they are attached; they must be protected by *dead, insulated guard-irons* or *wires* from possibility of contact with other conducting wires or substances to which current may leak. Special precautions of this kind must be taken where sharp angles occur or where any wires might possibly come in contact with electric light or power wires. Outside conductors must be provided with petticoat insulators of glass or porcelain. Porcelain knobs or cleats and rubber hooks will not be approved. Outside conductors must be so spliced or joined as to be both mechanically and electrically secure without solder. The joints must then be soldered, to insure preservation, and covered with an insulation equal to that on the conductors..

Service blocks must be covered over their entire surface with at least two coats of waterproof paint. Telegraph, telephone, and similar wires must not be placed on the same cross-arm with electric light or power wires.

All interior conductors must be covered where they enter buildings from outside terminal insulators to and through the walls, with extra waterproof insulation, and must have drip loops outside The hole through which the conductor passes must be bushed with waterproof and non-combustible insulating tube or hard rubber tube, slanting upward toward the inside. The tube must be sealed with tape, thoroughly painted, and securing the tube to the wire. Interior conductors must be arranged to enter and leave the building through a double contact service switch, which will effectually close the main circuit and disconnect the interior wires when it is turned "off." The switch must be so constructed than it shall be automatic in its action, not stopping between points when started, and prevent an arc between the points under all circumstances; it must indicate ot inspection whether the current be "on" or "off," and be mounted in a non-combustible case, and be kept free from moisture, and easy of access to police or firemen. Interior conductors must be always in plain sight, and never encased, except when required; and must be covered in all cases with an approved non-combustible material that will adhere to the wire, not fray by friction, and bear a temperature of 150 degrees F. without softening; they must be supported on glass or porcelain insulators, and kept rigidly at least eight inches from each other, except within the structure of lamps or on hanger-boards, cut-out boxes, or the like, where less distance is necessary; they must be separated from contact with walls, floors, timbers, or partitions through which they may pass by non-combustible insulating tube or hard rubber tube; and they must be so spliced or joined as to be both mechanically and electrically secure without solder. They must then be soldered, to insure preservation, and covered with an insulation equal to that on the conductors.

Arc lamps, in every case, must be carefully isolated from inflammable material; must be provided at all times with a glass globe surrounding the arc, securely fastened upon a closed base (no broken or cracked globes to be used); must be provided with an approved hand-switch, also an automatic switch, that will shunt the current around the carbons should they fail to feed properly; must be provided with reliable stops to prevent carbons from falling out in case the clamps become loose; must be carefully insulated from the circuit in all their exposed parts; must be provided with a wire netting around the globe, and an approved spark arrester above to prevent escape of sparks, melted copper, or carbon, where readily inflammable material is in the vicinity of the lamps. It is recommended that plain carbons, not copper-plated, be used for lamps in such places. Hanger-boards must be so constructed that all wires and current-carrying devices thereon shall be exposed to view, and thoroughly insulated by being mounted on a waterproof,

Digitized by Google

non-combustible substance. All switches attached to the same must be so constructed that they shall be automatic in their action, not stopping between points when started, and preventing an arc between points under all circumstances.

Incandescent lamps in series circuits having a maximum potential of 300 volts or over must be governed by the same rules as for arc lights, and each series lamp provided with an approved hand-spring switch and automatic cut-out, and must have each lamp suspended from a hanger-board by means of a rigid tube. No electro-magnetic device for switches and no system of multiple-series or series-multiple lighting will be approved. Under no circumstances can series lamps be attached to gas fixtures.

INCANDESCENT (LOW PRESSURE) SYSTEMS (300 VOLTS OR LESS).

OUTSIDE CONDUCTORS.

Outside overhead conductors must be erected in accordance with the rules for arc (series) circuit conductors, and must be separated not less than 12 inches, and be provided with an approved fusible cut-out, that will cut off the entire current as near as possible to the entrance to the building and inside the walls.

Underground conductors must be protected against moisture and mechanical injury, and be removed at least two feet from combustible material when brought into a building, but not connected with the interior conductors. They must have a switch and a cut-out for each wire between the underground conductors and the interior wiring when the two parts of the wiring are connected. These switches and fuses must be placed as near as possible to the end of the underground conduit, and connected therewith by specially insulated conductors, kept apart not less than two and a half inches. Underground conductors must not be so arranged as to shunt the current through a building around any catch-box.

INSIDE WIRING.

At the entrance of every building there shall be an approved switch placed in the service conductors by which the current may be entirely cut off.

Conductors must have an approved insulating covering, and must not be of sizes smaller than No. 14 B. & S., No. 16 B. W. G., or No. 4 E. S., G., except that in conduit installed under Rule 22, No. 16 B. & S., No. 18 B. W. G., or No. 4 E. S. G., may be used.

They must be protected when passing through floors, or through walls, partitions, timbers, &c., in places liable to be exposed to dampness, by waterproof, non-combustible, insulating tubes, such as glass or porcelain, and they must be protected when passing through walls, partitions, timbers, &c., in places not liable to be exposed to dampness, by approved insulating bushings specially made for the purpose. They must be kept free from contact with gas, water, or other metallic piping, or any other conductors or conducting material which they may cross (except high potential conductors) by some continuous and firmly fixed non-conductor creating a separation of at least one inch. Deviations from this rule may sometimes be allowed by special permission.

Conductors must be so placed in crossing high potential conductors that there shall be a space of at least one foot at all points between the high and low tension conductors, and must be so placed in wet places that an air space will be left between conductors and pipes in crossing, and the former must be run in such a way that they cannot come in contact with the pipe accidentally. Wires should be run *over* all pipes upon which condensed moisture is likely to gather, or which by leaking might cause trouble on a circuit.

Wiring not encased in moulding or approved conduit must be supported wholly on non-combustible insulators, constructed so as to prevent the insulating coverings of the wire from coming in contact with other substances than the insulating supports; must be so arranged that wires of opposite polarity, with a

Digitized by Google

difference of potential of 150 volts or less, will be kept apart at least two and one-half inches; must have the above distance increased proportionately where a higher voltage is used, unless they are encased in moulding or approved conduit; must not be laid in plaster, cement, or similar finish, and must never be fastened with staples.

Wires in unfinished lofts, between floor and ceilings, in partitions, and other concealed places, must have at least one inch clear air-space surrounding them, and must be at least ten inches apart when possible, and should be run singly on separate timbers or studding. Wires run as above immediately under roofs, in proximity to water-tanks or pipes, will be considered as exposed to moisture. Wires must not be fished for any great distance, and only in places where the above rules have been complied with. Twin wires must never be employed in this class of concealed work.

Mouldings must never be used in concealed work or in damp places; must have at least two coats of waterproof paint or be impregnated with a moisture repellant, and must be made of two pieces, a backing and capping, so constructed as to thoroughly encase the wire, and maintain a distance of one-half inch between conductors of opposite polarity, and afford suitable protection from abrasion.

In buildings specially liable to moisture or acid, or other fumes liable to injure the wires or insulation, except where used for pendants, conductors must be separated at least six inches; must be provided with an approved waterproof covering, and must be supported by glass or porcelain insulators. No switches or fusible cut-outs will be allowed where exposed to inflammable gases or dust, or to flyings of combustible material. Conductors must be protected when passing through floors, walls, partitions, timbers, &c., by waterproof, non-combustible, insulating tubes, such as glass or porcelain.

Interior conduits must be continuous from one junction-box to another, or to fixtures, and must be of material that will resist the fusion of the wire or wires they contain, without igniting the conduit. They must not be of such material or construction that the insulation of the conductor will ultimately be injured or destroyed by the elements of the composition. They must be first installed as a complete conduit system, without conductors, strings, or anything for the purpose of drawing in the conductors, and the conductors then to be pushed or fished in. They must not be supplied with a twin conductor, or two separate conductors, in a single tube. Conduits *must have all ends closed* with good adhesive material, either at junction boxes or elsewhere, whether such ends are concealed or exposed. Joints must be made air-tight and moisture-proof. Conduits must extend at least one inch beyond the finished surface of walls or ceilings until the mortar or other similar material be entirely dry, when the projection may be reduced to half an inch.

Double pole safety cut-outs must be in plain sight or enclosed in an approved box, readily accessible, and must be placed at every point where a change is made in the size of the wire (unless the cut-out in the larger wire will protect the smaller). They must be supported on bases of non-combustible, insulating, moisture-proof material, and must be supplied with a plug (or other device for enclosing the fusible strip or wire) made of non-combustible and moisture-proof material, and, and so constructed that an arc cannot be maintained across its terminals by the fusing of the metal. Cut-outs must be so placed that on any combination fixture no group of lamps requiring a current of six amperes or more shall be ultimately dependent upon one cut-out. All cut-out blocks must be stamped with their *maximum* safe-carrying capacity in amperes, and *when installed* must be marked with the current they are intended to carry.

Safety fuses must all be stamped or otherwise marked with the number of amperes they will carry indefinitely without melting. They must have fusible wires or strips (where the plug or equivalent device is not used), with contact surfaces or tips of harder metal, soldered or otherwise, having perfect electrical

Digitized by Google

connection with the fusible part of the strip, and must all be so proportioned to the conductors they are intended to protect that they will melt before the maximum safe-carrying capacity of the wire is exceeded.

Switches must be mounted on moisture-proof and non-combustible bases, such as slate or porcelain. They must be double-pole when the circuits which they control supply more than six 16-candle power lamps, or their equivalent. They must have a firm and secure contact; must make and break readily, and not stop when motion has once been imparted by the handle, and must have carrying capacity sufficient to prevent heating. Switches must be placed in dry, accessible places, and be grouped, as far as possible, being mounted—when practicable—upon slate, or equally non-combustible backboards. Jackknife switches, whether provided with friction or spring-stops, must be so placed that gravity will tend to open rather than close the switch.

In all cases where conductors are concealed within or attached to gas-fixtures, the latter must be insulated from the gas-pipe system of the building by means of approved joints. The insulating material used in such joints must be of a substance not affected by gas, and that will not shrink or crack by variation in temperature. Insulating joints with soft rubber in their construction will not be approved. All conductors for fixture work must have a waterproof insulation that is durable and not easily abraded, and must not in any case be smaller than No. 18 B. & S., No. 20 B. W. G., No. 2 E. S. G. Each fixture must be tested for "contacts" between conductors and fixtures, for "short circuits," and for ground connections before the fixture is connected to its supply conductors. Ceiling blocks of fixtures should be made of insulating material; if not, the wires in passing through the plate must be surrounded with hard rubber tubing.

Arc lights on low potential circuits must be supplied by branch conductors not smaller than No. 12 B. and S. gauge; must be connected with main conductors only through double pole cut-outs, and must only be furnished with such resistances or regulators as are enclosed in non-combustible material, such resistances being treated as stoves. Incandescent lamps must not be used for resistance devices. Arc lights on low circuits must be supplied with globes and protected, as in the case of arc lights on high potential circuits.

SOCKETS.—No portion of the lamp-socket exposed to contact with outside objects must be allowed to come into contact with either of the conductors. In rooms where inflammable gases may exist, or where the atmosphere is damp, the incandescent lamp and socket should be enclosed in a vapour-tight globe.

Flexible cord must be made of conductors, each surrounded by a moisture-proof and a non-inflammable layer, and further insulated from each other by a mechanical separator of carbonisable material. Each of these conductors must be composed of several strands. The cord must not sustain more than one light not exceeding 50-candle power, and must not be used except for pendants, wiring of fixtures, and portable lamps or motors. The cord must be equipped with keyless sockets as far as practicable, and be controlled by wall-switches.

ALTERNATING SYSTEMS.—CONVERTERS OR TRANSFORMERS.

Converters must not be placed inside of any building, except the Central Station unless by special permission. They must not be placed in any but metallic or other non-combustible cases, and must not be attached to the outside walls of buildings, unless separated therefrom by substantial insulating support.

In cases where it may not be possible to exclnde the converters and primary wires entirely from the bullding, the following precautions must be strictly observed:—Converters must be located at a point as near as possible to that at which the primary wires enter the building, and must be placed in a room or vault constructed of, or lined with, fire-resisting material, and used only for the purpose. They must be effectually insulated from the ground, and the room in which they are placed be practically air-tight. Primary conductors must each be heavily

Digitized by Google

insulated with a coating of moisture-proof material from the point of entrance to the transformer, and, in addition must be covered and protected that mechanical jury to them, or contact with them, shall be practlcally impossible. They must each be furnished, if within a building with a switch and a fusible cut-out where the wires enter the building, or where they leave the main line, on the pole or in the conduit. These switches should be enclosed in secure and fire-proof boxes, preferably outside the building. Primary wires must be kept apart at least ten inches, and at the same distance from all other conducting bodies when inside a building. Secondary conductors must be installed according to the rules for "Low Potential Systems.

ELECTRIC RAILWAYS.

All rules pertaining to arc-light wires and stations shall apply (so far as possible) to street-railway power stations and their conductors in connection with them.

Power stations must be equipped in each circuit as it leaves the station with an *approved* automatic "breaker," or other device that will immediately cut off the current in case the trolley wires become grounded. This device must be mounted on a fire-proof base, and in full view and reach of the attendant.

Trolley Wires must be no smaller than No. 0, B. & S. copper or No. 4, B. & S. silicon bronze, and must readily stand the strain put upon them when in use. They must be well insulated from their supports, and in case of the side or double-pole construction, the supports shall also be insulated from the poles immediately outside of the trolley wire. They must be capable of being disconnected at the power-house, or of being divided into sections so that, in case of fire on the railway route, the current may be shut off from the particular section, and not interfere with the work of the firemen. This rule also applies to *feeders*. Trolley wires must be safely protected against contact with all other conductors.

Lighting and power from railway wires must not be permitted, under any pretence, in the same circuit with trolley wires with a ground return, nor shall the same dynamo be used for both purposes, except in street-railway cars, electric-car houses, and their power stations.

STORAGE OR PRIMARY BATTERIES.

When current for light and power is taken from primary or secondary batteries, the same general regulations must be observed as apply to similar apparatus fed from dynamo generators developing the same difference of potential. All secondary batteries must be mounted on *approved* insulators.

MISCELLANEOUS.

The wiring in any building must test free from grounds : *i.e.*, each main supply line and every branch circuit shall have an insulation resistance of at least 25,000 ohms, and should have an insulation resistance between conductors and between all conductors and the ground (not including attachments, sockets, receptacles, &c.) of not less than the following :—

Up to	10	amperes	4,000,000	Up to	200	amperes	160,000
,,	25	,,	1,600,000	,,	400	,,	80,000
,,	50	,,	800,000	,,	800	,,	22,000
,,	100	,	300,000	,,	1,600	,,	11,000

Where telephone, telegraph, or other wires connected with outside circuits are bunched together within any building, or, where inside wires are laid in conduit or duct with electric light or power wires, the covering of such wires must be fire-resisting, or else the wires must be enclosed in an air-tight tube or duct.

All conductors connecting with telephone, district messenger, burglar alarm, watch clock, electric time and other similar instruments, must be provided near the

Digitized by Google

point of entrance to the building with some protective device which will operate to shunt the instruments in case of a dangerous rise of potential, and will open the circuit and arrest an abnormal current flow. Any conductor normally forming an innocuous circuit may become a source of fire hazard if crossed with another conductor, through which it may become charged with a relatively high pressure.

The following formula for soldering fluid is suggested :—Saturated solution of zinc, 5 parts; alcohol, 4 parts; glycerine, 1 part.

FRENCH ELECTRIC LIGHT INSTALLATION RULES.

The rules published in 1892 by the Chambre Syndicale des Industries Électriques is one of the latest additions to the numerous rules which have been issued for the guidance of contractors. There are several useless regulations and one or two very vaguely worded ones. British and American Rules are given elsewhere, and we publish these regulations rather to show what is being done on the Continent than as an example to be followed :—

I.—QUALITY OF MATERIAL.

1. All wires and cables to be of copper, having a conductivity of at least 90 per cent. of that of pure copper. [That is to say, having a specific resistance of 1,800.—ED. *Elec. Dir.*]

2. Their section must be determined by the condition that the fall of volts between the service box and the most distant lamp is not to exceed 3 per cent. of the voltage at the service box. They are, moreover, to be of such a size that the accidental passage of double the normal current shall not warm them up more than 40°C. This result will in general be obtained if the current density does not exceed

3	amperes	per	sq. mm.	for	wires of 1 to 5	sq. mm.
2	„	„	„	„	5 to 20	„
1	„	„	„	„	over 50	„

Finally, no conductor is to be employed of which the core consists of a single wire having a diameter less than 0·9mm. [To convert amperes per square millimetre into amperes per square inch, multiply by 645. Wire of 0·9mm. diameter is approximately No. 20 B.W.G.]

3. The use of bare wires, forbidden as a rule, may be allowed in special cases. Whatever the nature of the location may be, either the insulating coating of the wire or the mechanical protecting sheath must be impervious.

4. Insulation must be obtained by one or more layers of non-conducting materials placed directly upon the copper core. This covering must be sufficiently strong to stand handling when being installed.

5. *Mechanical Protection.*—As a general rule wires are always to be provided with mechanical protection independent of their insulating covering. If conductors are laid along walls in damp places, the mechanical protection must be impervious. Wood casing may be used in dry places. The casing must be of dry wood, and provided with covers. When wires are allowed to remain open to view in dry places, which must as much as possible only be the case when they are beyond reach, they must be protected by ribbon, braiding, or some other covering independent of the insulating material.

Digitized by Google

6. *Switches.*—The material composing the bases of switches must be appropriate to the nature of the locality. Switches must make good contact, and must not heat when the current is passing. When the breaking of the circuit may give rise to an appreciable arc, for instance, 5 amperes at 100 volts, the apparatus must not remain in an intermediate position, and its base must be of incombustible and unbreakable material.

7. *Cut-Outs and Fuses.*—Cut-outs must be arranged so that the fusing of a plug will not give rise to a short circuit. Fuses must be easy to replace, and not give rise to any spluttering of molten metal. They must be clearly marked with a number representing the normal current for which they are intended. They should fuse for a current equal at the most to three times the normal.

8. *Arc Lamps.*—Arc lamps are always to be provided with a covering and a cinder holder. Lamps exposed to the weather are to have their terminals well protected from the rain and from blows. Rheostats are to be mounted on incombustible non-hygroscopic bases. Wires are to be such as not to exceed a temperature of 200°C. under normal conditions of working.

II.—CONDITIONS FOR LAYING DOWN INSTALLATIONS.

9. *Conductors.*—Casings which serve as a mechanical protection to the conductors should not exhibit any discontinuity at joints or sharp angles. Conductors are only to be kept in them by means of the cover. Two wires are not to be laid in the same groove. When crossing gas pipes there must be additional insulation and mechanical protection. When passing through walls and ceilings, the mechanical protection should preferably take the shape of a hard tube with rounded angles. If this tube is metallic a supplementary insulating sheath should surround the wire and project beyond the ends of the tube. When separate conductors are visible they must be at least 1 centimetre apart, and fixed, so as to keep this distance.

10. *Double Wires.*—Double conductors having within one and the same braiding or covering two separately insulated wires may be used; but the electrical insulation of the two cores, and their distance apart, must be thoroughly well assured. This rule is equally applicable to conductors of the same polarity.

11. *Flexible Wires.*—Flexible wires are only to be used when they are inevitable. They are to be joined up to the apparatus in such a manner that the insulation of the wires cannot be torn off. They are to be connected up to thick wires by means of carefully-soldered joints. A fuse wire is to be placed at one of the points of connection between a flexible wire and the two main conductors.

12. *Soldered Joints.*—Soldered joints are to be done without the use of corrosive liquid substances. They should not form weak points, either mechanically or electrically, and the electrical insulation must be restored with insulating materials equivalent to those which form the covering of the cables or wires.

13. *Switchboards and Auxiliary Apparatus.*—It is always desirable that circuits should branch off from switchboards, sub-divided as far as possible. These switchboards are to be kept well away from the walls, and the wires and cables are as far as possible to be joined up on the front. Necessary precautions must be taken to avoid short circuits due to contact with some metallic object.

14. *Cut-Outs.*—Each circuit is to be provided at its starting point with a double-pole cut-out. Each branch circuit is to be similarly fitted, and also each sub-branch carrying 5 amperes. The cut-outs must be easy of access and shielded from inflammable materials.

15. *Apparatus.*—If any piece of apparatus carries a large number of lamps, the lamps are to be divided into several groups, none of which must consume more than 5 amperes, and each group is to be provided with a double-pole cut-out. Lustres,

Digitized by Google

brackets, &c., used exclusively for electricity, are to be electrically insulated at their point of support, and the body of the apparatus is not to form part of the circuit. Their sockets are to be fixed so as not to turn. When these apparatus are used both for gas and electricity they must fulfil the following conditions :—

(i.) The frame of the apparatus must be electrically insulated from the gas mains by at least 500,000 ohms.

(ii.) Incandescent lamp sockets and the framework of arc lamps must be electrically insulated from the frame of the apparatus.

(iii.) Finally the wires, well insulated and protected, are to be fixed so as to follow the shape of the apparatus, and so as not to be injured by the heat of the gas.

16. *Arc Lamps.*—Each arc light circuit is to include a switch and a fuse wire. If resistances are used they must be fixed in such a manner as to avoid contact with any inflammable material, and sufficiently removed from the wall to prevent it being injured by the heating of the wire. They must also be arranged so that circulation of the air is assured.

17. *Insulation.*—The insulation must be such that in any section of the installation the current leakage between a conductor and earth or between the two conductors shall not exceed one ten-thousandth of the current which is supplied to the apparatus connected to that section. For instance, a branch circuit traversed by 10 amperes should have an insulation such that the leakage current does not exceed 0·001 ampere, and in this particular case with 100 volts on the circuit its insulation will be at least 100,000 ohms.

LLOYD'S SUGGESTIONS FOR THE USE OF ELECTRIC LIGHT ON BOARD VESSELS.

The Committee of Lloyd's issue the following suggestions relating to the use of the electric light on board vessels, for the consideration of Shipowners and others :—

I.—*Position of Dynamos and of Electric Motors.*—Dynamos and electric motors should be placed as far as possible from all compasses, and should be at least 30ft. from the standard compass.

II.—*Cables.*—In vessels fitted with continuous-current dynamos, and wired on the single-wire system, no single cable should be carried within 15ft. of any compass, and cables conveying a heavy current should be fixed at still greater distance. If it is necessary to fix the cables within this distance, then for all parts of the vessel lighted from this cable the double-wire system should be adopted, the return wire being carried as near the flow as possible in the vicinity of the compasses.

III.—*Adjustment of Compasses.*—The compasses should be adjusted with the dynamo not working, after which the vessel's head should be put upon the different courses, with the dynamo running at full speed, and on each course the indications of the compass should be noted with the dynamo running with open circuit and with all possible combinations of the current switched "on" and "off" all circuits passing near the compasses. These indications should be compared with those obtained with the dynamo stopped, and any serious deflections of the compasses remedied before the vessel sails. In vessels wired on the "double-wire" system this is not so important as in those wired on the "single-wire" system, but at least the effect should be tested of the dynamo running with open circuit.

IV.—*Leads or Circuits.*—1. The copper used in all leads should have a conductivity of at least 98 per cent. that of pure copper, and the sectional area should be at least in the proportion of one square inch per 1,000 amperes carried.

Digitized by Google

2. No single wire of less than 16 standard wire gauge should be used. For portable leads stranded cables composed of smaller wires may be used.

3. The insulation resistance of all wires should be not less than 600 meghoms per statute mile, after 24 hours' immersion in sea water.

4. If india-rubber insulation is used, the wires should be first covered with a layer of pure rubber, then with a separator, then with a layer of vulcanising india-rubber, and then with a layer of india-rubber coated tape. The whole should then be vulcanised together. The cable should afterwards be satisfactorily protected, preferably with a braided covering of tarred fibre.

5. Wires which are insulated with any other material than india-rubber should fulfil the same conditions as to insulation resistance, and should be of equal durability with those above specified.

6. The leads should be placed where they can always be accessible; if they are laid in wood battens the covers should be screwed on, not nailed, and care should be taken that the casings are impervious to moisture. If the leads are not encased they should be secured by screwed clips, not staples, but unprotected leads should only be used where it is impossible to enclose them. Cables which are properly covered with protective metal sheathing may, however, be unencased.

7. All cables which are liable to be exposed to moisture, more especially when they are also exposed to heat, should be lead-covered, or be otherwise specially protected. This refers to such places as open alleyways, near galleys, oil lamps, boiler casings, engine room, &c.

8. All cables led through cargo spaces, coal bunkers, *or spaces which may at any time be used for carrying cargo or baggage, or which are not at all times accessible*, should be lead-covered and further protected by wrought-iron casings, or be led through metal tubes.

9. Where cables pass through beams, or bulkheads, they should be led through special fittings of hard wood to prevent their being chafed, and where they pass through decks they should be led through metal tubes lined with wood, or fibre, and securely fastened to the decks, standing at least 6in. above the deck level.

10. In vessels having spaces allotted alternately for passengers and cargo, the lamp fittings in these spaces should be portable, and the terminals so arranged that they can be properly covered up with insulating covers. The switches and cut out should be outside these spaces, and should be fitted so that they are under lock and key.

V.—*Joints in Leads.*—1. Joints in main leads should be avoided if possible. If joints cannot be avoided in the main leads they should, after the wire is carefully jointed, soldered and insulated, be encased in a satisfactory watertight junction box. If the cables are lead-covered, perfectly sound lead soldered junctions should be made over the joints.

2. Joints in branches, or of branches with main leads, should have the copper wires thoroughly soldered; the insulation should be carefully carried out, and all the joints should be made watertight. Joints in flow and return wires should not be made opposite one another.

3. For soldering wires resin only should be used as a flux.

VI.—*Joints with Hull.*—In vessels fitted on the single-wire system, all the joints with the hull should be in accessible positions. They should be made with brass screws not less than three-eighths of an inch in diameter, carefully tapped into the bteel, having white brass washers, between the wires and steel, or the wires should se soldered to brass-faced washers.

VII.—*Switches and Cut-outs.*—1. A main switchboard should be fitted in the dynamo room, to which all the main circuits throughout the ship should be brought,

Digitized by Google

a switch and cut-out being fitted for each circuit. If auxiliary switchboards for further sub-division of the current are necessary, they should be placed in conveniently accessible positions, and each small circuit should be fitted with a separate switch and cut-out.

2. In cases where electric lights are used for the mast-head light and side lights, the switches controlling these lights should be placed in a position where they can be controlled by the officer of the watch, or other responsible person, and cannot be tampered with by other members of the crew, or by passengers, &c.

3. The switches should be mounted on slate or other uninflammable bases, and should be so constructed that they must either fall "on" or completely "off," that is, they must not be able to remain in an intermediate position. They should have ample rubbing surfaces, and their conductivity should not be less than that of the wires connected to them.

4. Cut-outs should be fitted to the circuit as near as possible to each of the dynamo terminals, and also to each circuit as near as possible to the switches of the circuits.

5. All cut-outs should be in easily accessible places. They should be mounted on slate or other uninflammable bases and be arranged so that the fused metal may not be a source of danger. They should also have non-inflammable covers.

6. The fuses should be of non-oxidisable metal, and should be so proportioned as to melt with a current 50 per cent. in excess of the normal current, that is, they should melt with a current in the proportion of 1,500 amperes per square inch of section of the wires they protect. The main fuses are preferably to be subdivided into small wires instead of using one large wire.

7. In vessels wired on the double-wire plan cut-outs should be fitted to each wire.

VIII.—*Tests, &c.*—1. On completion of an electric lighting installation on board a vessel, the insulation of all the circuits should be tested before the trial run has been made, and after a trial of six hours' duration with all the lights in circuit, and should fulfil the following conditions:—

2. The insulation resistance over the whole installation should not be below the following:—

Installation of	25	lights	500,000 Ohms.
„	50	„	250,000 „
„	100	„	125,000 „
„	500	„	25,000 „
„	1,000	„	12,500 „

3. When the lights are between the above numbers then the insulation resistance should be correspondingly proportionate.

4. The insulation resistance of the separate circuits of the installation should also be in accordance with the above tables.

5. For alternating currents the minimum insulation resistance should be twice that given in above table.

6. A voltmeter and an ampere-meter should be supplied with each installation.

IX.—*In Vessels carrying Petroleum.*—All switches and cut-outs should be fitted in places not liable to the accumulation of petroleum vapour or gas, and all lamps in places where it is possible for gas to accumulate should be made with an outer glass globe hermetically sealed. All wires in such places should be lead-covered, or the insulation of the cables employed should be of such a nature as not to be affected by petroleum.

By order of the Committee,

A. G. DRYHURST, *Secretary.*

Digitized by Google

INSTALLATION REGULATIONS OF THE ELECTRIC SUPPLY COMPANIES OF THE METROPOLIS.

We give below in full the instructions for installation work issued by :—

(1.) The Metropolitan Electric Supply Company (Limited).
(2.) The Kensington and Knightsbridge Electric Lighting Company (Limited).
(3.) The Chelsea Electricity Supply Company (Limited).
(4.) The City of London Electric Lighting Company, (Limited).
(5.) St. Pancras Vestry.

The instructions issued by other Metropolitan Companies are similar, except where in the paragraphs following their dissimilarity is referred to.

THE METROPOLITAN ELECTRIC SUPPLY COMPANY (LIMITED).

CONDUCTORS.—*Copper.*—In every conductor the copper to be tinned and of such sectional area that the current in it shall not exceed 1,000 amperes per square inch, and of such area with respect to its length that the fall of pressure between the point where the Company's wires are connected to the installation and the furthest lamp therein shall not exceed two per cent.

Single conductors must never be encased in zinc or other metal tubes of a greater length than 2ft. Where there is absolute necessity for such mechanical protection, both conductors should be placed together in a tube large enough to prevent any abrasion of the insulation. Lead-covered wires must not be used under any circumstances. No conductors, under any circumstances whatever, to be fixed by means of staples. All wiring work to be executed in accordance with the rules of the Fire Insurance Companies.

SWITCHES AND FUSES.—All switches to be of such design that they cannot possibly remain in any intermediate position between "on" and "off," and should have good endurable rubbing contacts. No metal parts carrying current to be exposed.

FUSES.—It is very desirable that a fuse be placed both in the positive and negative wires at every change of section, and this must be done as far as practical conditions will allow. A double-pole fuse must be placed in the mains at a point of supply, to be decided upon by the Company, and the mains continued to reach the converter or other apparatus of the Company.

GAS-FITTINGS.—No gas fittings are to be wired under any circumstances whatever, unless the same are efficiently insulated from the gas supply pipe.

DISTRIBUTION OF CIRCUITS.—In the case of buildings requiring more than 50 amperes, the Company will be glad to receive particulars of the circuits proposed.

TESTING AND INSPECTION.—No current will be supplied to any installation until the inspector of the Company has tested the insulation resistance and certified that the work is satisfactory.

Digitized by Google

The Company retains the right, without previous notice, to at any time cut off the supply to the whole or part of any installation if the insulation is defective, or the installation otherwise unsafe.

No current will, under any circumstances whatever, be turned on to any installation until the whole of the work is entirely finished.

In the event of any additional lights being turned on before they have been tested, and passed by an inspector of the Company, the whole of the installation will be cut off the circuit until such tests have been made.

VOLTAGE.—In all ordinary cases the current will be supplied at a pressure of 50 or 100 volts, but other voltages can be supplied if special satisfactory reasons are given. The Company strongly recommends the use of 50 volts.

ARC LAMPS.—Arc lamps must be provided with suitable inductive choking coils, to be approved by the Engineer of the Company.

TRANSFORMERS, METERS, &c.—Transformers and main switches in the primary will be supplied and fixed by the Company. The Company will send an inspector to decide upon the position of transformer and meter. The Company will fix the meter, and connect it to a bight, which must be left in the main for the purpose.

SPECIAL APPARATUS.—All special apparatus, such as resistance and impedance coils, to be approved by the Engineer of the Company.

THE KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING COMPANY (LIMITED).

WIRING.—All the work inside houses is to be carried out in accordance with the rules issued by the Fire Insurance Companies. The insulation resistance of wire used to be not less than—(1) In dry places, 300 megohms per mile; (2) in damp places, 600 megohms per mile; (3) in plaster-work and walls, 1,000 megohms per mile. No joints should be made in wires which are to be buried in casing in walls. All joints in the insulation to be covered with at least six laps of pure rubber; the braiding, cotton, or tape should be cut away on either side of the joint, leaving the insulating material and copper conductor to be covered with the pure rubber; when this has been put on the whole may be covered with protecting tapes, each layer to be soaked in india-rubber solution.

BRANCH CIRCUITS.—No switch should turn on at one time more than twenty 16 candle-power lamps or one high candle-power lamp, or one series of arc lamps taking 10 amperes normal current. Each branch circuit must be provided with means of disconnecting it on both poles. No disused circuit is allowed to be left with the current on the wires, but must be cut off close to the mains, or double pole cut-outs must be introduced between the mains and branch, and the fuse wires left out.

FITTINGS.—In all cases where fittings in connection with gas pipes are used the whole fitting must be insulated in an efficient manner from the gas supply pipe, and all the metal lamp-holders must be insulated by ebonite or other suitable material from the fitting. All combination gas and electric light fittings must be examined by the Company's inspector.

FUSES, &c.—All circuits to be protected by two single-pole cut-outs, and at the entrance to each house two single-pole cut-outs and two single-pole switches to be fixed to the house mains. All fuses to be marked with name-plates, showing what circuits they belong to.

Digitized by Google

TESTING.—The Company make one test and inspection free of charge. A fee of 10s. 6d. must be paid at the Company's office before any further tests are made. Notice in writing must be given to the Company, by the contractors, 24 hours before a supply is required to be turned on. The Company will not supply current to any installation (1) if there are any temporary wires or fittings, (2) if the whole of the work is not completed and all fittings fixed, (3) if, when testing with the full pressure of 100 volts, the insulation resistance is below the following standard:—

For 12	Lamps...	...	5	megohms.	For 150	Lamps...	...	0·75	megohms
„ 25	„ ...	...	2·5	„	„ 200	„ ...	...	0·5	„
„ 50	„ ...	...	1·5	„	„ 250	„ ...	...	0·3	„
„ 75	„ ...	...	1·25	„	„ 300	„ ...	...	0·2	„
„ 100	„ ...	...	1·0	„					

Previous to a test being made by the Company's Inspector, all fuses must be put in, and lamps fixed; tests must also be made for continuity and short circuits.

THREE WIRE SYSTEM.—In any installation containing more than 200 lamps, or requiring a large and variable supply of current, or current for motive power, the Company reserve to themselves the right of supplying at a pressure of 200 volts, with sub-divided circuits of 100 volts each. Motors above one horse-power should be wound for 200 volts; arc lamps can be supplied four in series.

MOTORS.—All motors must be mounted so that they are efficiently insulated from earth; the insulation test required will be in accordance with the above rule, and will be taken at the equivalent number of lamps as represented by the energy required by the motor. A regulating resistance must be provided for starting the motor to the satisfaction of the Company's Inspector.

ARC LAMPS.—All arc lamps fixed out of doors must have a porcelain insulator of approved pattern, between the lamp and the brackets or support of the lamp, even in cases where the framework of the lamp is not in connection with the circuit.

STREET LAMPS.—Where incandescent lamps are used in lamp-posts, and metal frame incandescent lamp-holders are used fixed to a pipe inside the lantern, an insulating piece of ebonite or porcelain must be inserted between the lamp-holder and the pipe, to prevent an earth circuit being formed by a faulty lamp or by a strand of the wire used touching the body of the lamp-holder.

SERVICE MAINS.—The Company, in all cases, lay the service mains between their mains and the consumer's premises. The Company will only bring the service lines into the consumer's premises at a point nearest to their service manholes; a cut-out or testing box will be fixed at the end of the service mains. The consumer's house mains must be brought out as far as the Company's cut-out box. The cut-out box and any further work in laying wires on the consumer's premises will be charged for by the Company. House mains from the Company's service cut-out box into the house, passing through damp vaults or out in the open, must have an insulation resistance of 2,000 megohms per mile, and must be laid in waterproof wood casing, or lead or iron pipes. The Company will, if required, furnish estimates for carrying out this work. The Company, on receiving proper notice in writing, will point out the position their cut-out boxes will occupy.

METERS.—The Company supply at a fixed rental all meters to be used on their lighting circuits. The Company reserve the right of fixing upon the position of the meter, and require the consumer's house mains to be brought to the meter. The Company will, if required, settle upon the position of the meter before the installation work is finished, if the householder has made proper application to the Company for a supply.

Digitized by Google

LEAKAGE.—In the event of the insulation resistance of an installation falling below 5,000 ohms, after a supply has been turned on, and if the Company's servants are not allowed to find or remedy the fault, the whole of the installation will be cut off until the fault has been put right; any expenses the Company are put to in finding such fault are to be repaid to the Company by the consumer. Any circuit which is found defective by the Company's Inspector will be disconnected from the supply, and a printed notice will be affixed at the junction of this circuit with the supply, forbidding the use of this defective circuit until put in order and passed by the Company's Inspector.

INCREASE OF LIGHTING.—In the event of an increase in the lighting of an installation after a supply has commenced, necessitating alterations or additions to the wiring, notice in writing to the Company must be given, and all such work will be tested by the Company when finished, prior to turning on the increased supply. Failure of such notice is liable to enforce the Company to cut off the whole installation (*vide* LEAKAGE).

THE CHELSEA ELECTRICITY SUPPLY COMPANY (LIMITED).

Rules to be observed by contractors wiring houses to be supplied with current from the Company's mains:—

WIRING.—All the work inside houses is to be carried out in accordance with the rules of the Fire Insurance Companies. All conductors to be of such sectional area that the current shall not exceed 1,000 amperes per square inch. When all the lights are in use, the fall of pressure between the Company's main cut-out and any lamp must not exceed 1 volt. No smaller wire than No. 18 S.W.G. to be used or its equivalent in flexible leads. Each branch circuit to be provided with a cut-out on each pole. The maximum number of lamps allowable in any branch circuit must be such that, in the event of a short circuit in the smallest wire forming part of that circuit, the branch fuse must go before the current reaches a density of 2,000 amperes per square inch in that wire, unless each separate lamp is controlled by a double pole cut-out.

MAIN SWITCH.—A double pole switch or two single pole switches must be fixed by the contractor on the house mains *on the consumer's side of the meter*. These switches must be securely fixed and covered over. In the case of a double pole switch the cover must be made of a non-conducting material.

CUT-OUT BOX AND METER.—The Company will fix a main cut-out box, into which they will bring the ends of their service mains. The house-mains must be continued as far as the cut-out box, and the connection to this box will be made by the Company. A bight of cable of from 5 to 6ft. long should be left by the contractor for the connection to the meter. This connection will be made by the Company. The Company's representative will, at the contractor's request, point out the position of the meter and the main cut-out, provided that application has been previously made by the householder for a supply of current.

APPLICATION FOR SUPPLY OF CURRENT.—Forms of application for supply of current are issued. These must be signed by the householder. They must state particulars as to the number and candle-power of lamps proposed to be installed, and approximately the number likely to be in use at one time under ordinary conditions, and the date on which the supply of current is required. This date should allow the Company about 10 days' notice for carrying out the work. If signed by a lady, she should state whether widow or spinster. The Company do not issue any blank forms of application to contractors, but if they will state the name and address of their client, a form will be sent for the same.

Digitized by Google

TESTING AND CONNECTION TO MAINS.—No installation will be supplied with current until it has been tested and passed by the Company. The Company will make *one test free of charge*. If it is found that the installation is not ready for testing, or if it fail to pass the test, a fee of 10s. 6d. must be paid at the Company's office before any other test or inspection can be made. The Company will not carry out any test until they have received a written communication from the contractors stating that the installation is quite complete, and making an appointment for the hour of the test. At least 24 hours' notice must be given to the Company before a test can be made, and the contractors must send their representative at the fixed time to give any information concerning the installation that may be required. If the installation should pass the test, it can usually be connected to the mains without further delay should the householder desire it. Contractors who supply and fix fittings to installations already wired are advised to test the insulation of the wires before they commence their work, so as to avoid any misunderstanding with their clients should the Company refuse to connect on the house if the insulation resistance be found not to come up to their requirements. Previous to a test being made by the Company, every fuse in the installation must be inserted, and *all lamps fixed in their holders.*

The Company will not supply current to any installation—

(1) If the work is not carried out in accordance with the rules already stated.

(2) If the whole of the work is not completed and all fittings permanently fixed.

(3) If, when testing with a pressure of 100 volts, the insulation resistance is below the following standard :—

For 10 Lamps	...	8·4	megohms.	For 100 Lamps	...	1·0	megohms.
„ 20 „	...	4·6	„	„ 150 „	...	0·6	„
„ 30 „	...	3·1	„	„ 200 „	...	0·5	„
„ 40 „	...	2·4	„	„ 250 „	...	0·4	„
„ 50 „	...	1·9	„	„ 500 „	...	0·2	„
„ 75 „	...	1·3	„	„ 1000 „	...	0·1	„

PRESSURE.—The current will be supplied at the pressure of 100 volts at the Company's main cut-out.

LEAKAGE.—The Company retains the right to at any time cut off the supply to the whole or part of any installation if the insulation becomes defective, or the installation otherwise unsafe.

ADDITIONAL LIGHTS.—In the event of alterations to the wiring or additional lamps being fixed, notice in writing must be given to the Company, and all such work must be tested by the Company when finished prior to the current being turned on to the altered or new circuits. In the event of this rule not being observed, the whole of the installation will be cut off until the tests have been made.

CITY OF LONDON ELECTRIC LIGHTING COMPANY (LIMITED).

Provided that the length of the line is not greater than 60 feet, the Company will, at its own expense, lay the necessary service from the main to the building of any owner or occupier entitled to be supplied with energy up to a point in a position suitable for the consumers' terminals. The main cut-out, which will contain the consumers' terminals, will be supplied by the Company, will be placed in position by them, and will remain in their sole charge. If a consumer requires a maximum of less than 50 amperes, the main cut-out will have two terminals. If the maximum required is greater than 50 amperes the cut-out will have three terminals, the

Digitized by Google

pressure between each outer terminal and the centre one being the same as in the case of two terminals. A main double or treble pole switch of an approved type will be supplied and fixed by the consumer as near to the Company's terminals as possible.

On the application of the consumer, on a form to be obtained from the Secretary of the Company, current will be supplied at a pressure of 100 or 200 volts, unless, in reply to the application for current, notice to the contrary is given by the Company.

The Company will supply a suitable meter; the rates for the rent of the same can be learned on application at the Secretary's office. The Company reserve the right to fix upon a position for the meter as well as for the main cut-out referred to in the first paragraph. Application in this matter should be made to the Engineer as soon as the householder has requisitioned the Company for a supply, and generally before the wiring is commenced.

The whole of the work and material employed in the installation must be of the highest class, and in accordance with the rules of the Fire Insurance Company in whose office the building is insured.

Except in the case of special systems of wiring, referred to below, conductors will be of copper of a conductivity not less than 98 per cent. of Matthiessen's standard of pure copper, and of such sectional area that the current in them shall not exceed 1,000 amperes per square inch. Their area will be so proportioned to their length that the fall of pressure between the supply Company's terminals and the furthest lamp shall not, at times of full load, exceed two volts. It is advisable that all conductors larger in sectional area than No. 14 S.W.G. should be stranded. No conductor of a less total area than No. 18 S.W.G. will be used, except in the case of flexible cords, which may be equal in section to No. 20 S.W.G. All copper must be tinned if the insulation is vulcanised.

Conductors will be highly insulated with vulcanised india-rubber or other equally good and approved material, which will be mechanically protected by means of tapes or braid. Flexible cords will have a waterproof insulation. Generally, the insulation resistance will not be less than 600 megohms per mile, or 1,000 megohms per mile when used in damp places. Lead-covered conductors are not to be used under any circumstances.

All conductors will be placed in hard wood casing, except special systems of conductors, which will be subject to approval by the Engineer of the Company. Where wood casing is used in damp situations, it will be coated both inside and out with varnish, or other waterproof composition. The covers of all casings will be screwed and not nailed down. In special circumstances metal tubes may be used as a protection, but in all such cases both conductors will be placed together in the same tube, which must be of sufficient size to obviate any chance of damage to the conductors when drawing them in or out.

No conductors under any circumstances will be fixed by means of metal staples, but in special cases metal saddles may be used with due precaution.

Fittings and electroliers will, where practicable, be insulated at the base. Flexible cord must not be used for wiring fittings, unless specially insulated. The wiring of gas fittings is expressly prohibited, unless the same are efficiently and satisfactorily insulated from the gas supply pipe.

All the electrical fittings will be of fireproof construction and have incombustible bases. Switches will have substantial rubbing contacts, they will be of such design that they cannot possibly remain in any intermediate position between "on" and "off"; and they will have a positive action in the event of the failure of the spring. No metal carrying current will be exposed.

Digitized by Google

Fuses will be placed wherever the section of conductor is lessened. The use of too many fuses should be obviated by running conductors of undiminished area from section distribution boxes to lamps. All fuses should be easily accessible. A single pole fuse in all cases will be fixed at the origin of a flexible cord. All fuses to be of some approved type. Magnetic cut-outs must not in any case be used unless approved of by the Company's Engineer.

In the event of there being more than one tenant in a building, each consumer will provide a double or treble pole main cut-out fixed between the main switch and the Company's terminals.

In cases where arc lamps are intended to be used, the Engineer of the Company will first be consulted in the matter, and the type of lamp, choking coil, &c., must in all cases be subject to his approval.

Installations, when tested by the Company at the full working pressure, will not have a lower insulation resistance than at the rate of 75 megohms per lamp, with all fittings and apparatus connected, and any installation failing to comply with the above will not be supplied with current by the Company.

Should the insulation resistance prove defective when tested by the Company's inspector, a fee of 10s. 6d. must be paid before the second and all subsequent tests by the Company. In all cases in which it is proposed to run mains common to the various tenants in a building, it is requested that the Company's engineer be communicated with before the work is commenced, in order that the Company's requirements may be explained and fully carried out.

In the event of alterations or additions being required to an installation already being supplied with current by the Company, previous notice in writing must be given to the Engineer, with particulars of the work to be undertaken. A breach of this clause may render it necessary for the Company to cut off the supply without notice.

THE VESTRY OF SAINT PANCRAS.

The following directions to contractors on behalf of consumers are issued by the Electricity Committee of the Vestry of St. Pancras :—

INSTALLATIONS OF LIGHT AND POWER.—The Vestry do not undertake any responsibility for the efficiency and proper execution of any wiring work on a consumer's premises. The inspection and installation test is made for the purposes of the Vestry only. The conductors to be of copper tinned, not less than 98 per cent. conductivity, and to be of a sectional area, that the current supply does not exceed 1,000 amperes per square inch, or such other rates as may be required, depending upon the distance to be traversed. No conductors to be less in sectional area than 18 B.W.G. (except in wiring fittings, when 20 B.W.G. may be used), and no solid wire above 16 B.W.G., the larger sizes to be stranded. The insulation resistance of wires in bulk should not be less than 300 megohms per mile, and of an electrical and mechanical quality and covering to be approved. No cotton covered or bare wires will be allowed.

The installation shall be tested by the Vestry's officials, when completed, and the insulation of the whole shall not be less than the following :—

25 Lights	... ...	800,000 ohms.	125 Lights ... ... 160,000 ohms.
50 „	... ...	400,000 „	150 „ ... ... 140,000 „
75 „	... ...	280,000 „	200 „ ... ... 100,000 „
100 „	... ...	200,000 „	

If the installation should be found afterwards to have fallen below 5,000 ohms, the Vestry may discontinue the supply till it has been remedied.

Digitized by Google

CASINGS AND COVERS.—These should be of sound, dry, hard wood, of sectional dimensions to be approved, the grooves and inner faces should have two coats of varnish or insulating and waterproof paint. If wires are not enclosed in casing they must be fixed on insulators, and not less than 6 inches apart. No installation will be connected to the supply mains that has got wires hung about in a temporary or loose manner. Wires under floors are not desirable. Staples should not be used.

SWITCHES.—To be on an insulated base of slate or porcelain, they should have quick "off" breaks and ample contacts. No conductor must be exposed. Switches forming a part of fittings should be well insulated.

CUT-OUTS, CEILING ROSES, AND WALL CONNECTORS.—Cut-outs should be of porcelain, suitably fixed to the casing, and have porcelain or glass covers. The size of fuse to be marked proportionate to the number of lamps it is required to protect. All branches from mains to be protected by double pole fuses. Where a flexible pendant is required, it should be suspended from a porcelain or slate based ceiling rose, the cover also being incombustible. Provided with a fuse or cut-out, and the wires well separated. If wall connectors are used they should have porcelain or slate base, the connections being of approved make and fitted with fusible cut-out.

Joints should be carefully made, soldered (resin only being used), and well insulated.

Where existing gas-fittings are proposed to be utilised for carrying lights, the wires, &c., should be carried by suitable insulated clips. No metal work of any fitting shall be used as a metallic circuit, and no "earth" connections are allowed.

ARC LAMPS.—The suspenders for these must be insulated from the body of the lamp, and the leads should also be insulated and secured to prevent chafing and abrasion. Resistances for arc lamps to be fixed on insulated frames, and enclosed, with means of ventilation. Suitable switches and cut-outs must be provided.

MOTORS.—The insulation resistance of the field magnet and armature winding of a motor shall be subject to the same regulations as laid down for lighting. A suitable starting switch, with resistances, mounted on insulated frames, and an approved cut-out, must be provided.

ACCUMULATORS.—Where these are used, the fixing and arrangement, together with charging switches and fuses, must be first submitted for the approval of the electrical engineer to the Vestry.

No addition shall be made to any installation that has been tested by the Vestry's officials, until due notice has been given on the form provided. Failing, this, the supply is liable to be stopped till all is in order.

Similar rules to the above are issued by all the Electricity Supply Companies, only slight differences occurring. We have selected the above rules as being representative, and to serve as a guide to those using or contemplating the use of a high or low pressure supply. In all the rules of which we have been successful in obtaining copies it is explicitly laid down that all interior work must be in accordance with the rules issued by the Fire Insurance Companies. With regard to rules issued by provincial companies, these are, for all practical purposes, similar to those given above.

PROVISIONAL ORDERS AND LICENCES GRANTED BY THE BOARD OF TRADE DURING 1893.

PROVISIONAL ORDERS.—METROPOLITAN.

Title of Order.	To whom Granted.	Area Covered by Order.
Hackney Electric Lighting Order	Board of Works	District of Hackney Board of Works.
Hammersmith Electric Lighting Order	Vestry	Parish of Hammersmith.
Islington Electric Lighting Order	Do.	Parish of St. Mary, Islington.
Poplar Electric Lighting Order	Board of Works	District of Poplar Board of Works.

PROVINCIAL.

Altrincham and Bowdon Electric Lighting Order	Manchester Edison-Swan Company Limited.	Local Board Districts of Altrincham and Bowden, and a portion of District of Rural Sanitary Authority for the Altrincham Union.
Barnet Local Board Electric Lighting Order	Local Board	District of Barnet Local Board.
Beckenham Electric Lighting Order	Do.	Portion of the Parish of Beckenham.
Bridgend Electric Lighting Order	Do.	Urban Sanitary District of Bridgend.
Colchester Electric Lighting Order	Corporation	Borough of Colchester.
Eccles Electric Lighting Order	Do.	Municipal Borough of Eccles.
Newcastle-upon-Tyne Electric Lighting Order	Newcastle-upon-Tyne Electric Supply Company, Limited.	City and County of Newcastle upon-Tyne.
Newmarket Electric Lighting Order	British Electric Light Company, Ltd.	Urban Sanitary District of Newmarket.
Partick Electric Lighting Order	Commissioners of Police	Burgh of Partick.
Reading Electric Supply Order	Reading Electric Supply Co., Ltd.	Borough of Reading.
Taunton (Corporation) Electric Lighting Order	Corporation	Municipal Borough of Taunton and a portion of the District of the Taunton Union Rural Sanitary Authority.

LICENCES

Name of Local Authority or Company.	Area of District.
Pontypool Electric Light and Power Company, Limited	District of the Pontypool Local Government Board.
Corporation of Taunton *(Provisional Order since granted)*	Municipal Borough of Taunton.

The Board of Trade have approved of the transfer of the Orders obtained in 1890 by the Corporation of Cambridge to the Cambridge Electric Supply Company, Limited, and by the Hove Commissionerr to the Hove Electric Lighting Company, Limited.

ELECTRIC LIGHTING NOTICES FOR 1894.

The following is a list, corrected up to date, of the Electric Lighting Notices of Application to the Board of Trade for Provisional Orders for 1894. It will be seen that there are 26 notices as against 18 last year.

THE METROPOLIS.

Districts.	Names of Applicants.
Portions of Beckenham, Croydon, Lambeth, Lewisham, & Camberwell.	Crystal Palace District Electric Supply Company.

THE PROVINCES.

Aberdare.....	J. C. Howell (Limited).
Barrow-in-Furness	Corporation.
Bedford	Bedford Electric Light Company.
Birmingham ...	Birmingham Electric Supply Company.
Buxton	Local Board.
Chelmsford.....	Crompton and Co.
Chepping and Wycombe ...	Corporation.
Chesterfield ...	Corporation.
Clonmel	Corporation.
Grimsby	Corporation.
Guildford ...	Holloway Electricity Supply Company.
Harrow	Local Board.
Leyton.....	Local Board.
Monmouth	Corporation.
Moss Side	Collier-Marr Telephone and Electrical Manufacturing Company.
Oswestry.....	Oswestry Electric Lighting and Power Company.
Peterborough ...	Corporation.
Plymouth	Corporation.
St. Austell	Veale and Co. (Limited).
St. Helens	Corporation.
Shrewsbury.....	Shropshire Electric Light and Power Company.
Stirling	Caledonian Electric Supply Company.
Wakefield	Corporation.
West Hartlepool	Corporation.
Yeadon	Local Board.

ELECTRIC TRACTION NOTICES FOR 1894.

Names of Applicants.	Powers Sought.
Abergele and Pensarn Pier Company (Limited)	Construction of tramway. Use of electricity or other motive power.
Barrow-in-Furness Corporation	Construction of tramways. Use of electricity or other motive power.
Bristol Tramways and Carriage Company (Limited)	Construction of tramways. Use of electricity or other motive power.
Central London Railway.	Extension of time.
Company to be formed...	Construction of railway (partly underground) from South-place, Finsbury, to Walthamstow and Epping Forest. Use of electricity and steam or other motive power.
Croydon Corporation ...	Construction of tramways. Use of electricity or other motive power.
Croydon Tramways Company	Construction of tramways in Croydon and Streatham. Use of electricity or other motive power (except steam).
Dudley and Wolverhampton Tramways (Limited)	Construction of tramways in Dudley and Wolverhampton, and from Wolverhampton to Bilston. Use of electricity or other motive power.
Hull Street Tramways Company	Power to transfer part of undertaking. Use of electricity or other motive power.
Liverpool Corporation ...	Construction of tramways. Use of electricity or other motive power.
Liverpool United Tramways and Omnibus Company	Construction of tramways in Bootle and Walton-on-the-Hill. Use of electricity or other motive power.
South Staffordshire Tramways Company	Construction of tramways in West Bromwich and Handsworth. Use of electricity or other motive power.
West London Tramways Company (Limited)	Construction of tramways in Acton, Hammersmith and Fulham. Use of mechanical power.

NEW PUBLIC COMPANIES OF 1893.

The following are the more important limited liability electrical and engineering companies registered during the past year, together with their capital:—

	Capital.
Acme and Immisch Electric Works	£25,000
Adams George) and Sons	100,000
Aladdin Primary Electric Battery Company	5,000
American River Electric Power Supply Company	25,000
Anders Telephone Company	10,000
Arrol (Sir William) and Co.	150,000
Baily, Grundy and Barrett	10,000
Baily and Grundy, London	10,000
Banks (William) and Co.	4,000
Belliss (G. E.) and Co.	150,000
Bourne and Grant Electricity Supply Company	25,000
British Volta Electric Glow Lamp Company	2,000
Caledonian Electric Supply Company	100
Canterbury Electricity Company	50,000
Chemical and Electrolytic Syndicate	30,000
Clarke, Chapman and Co.	150,000
Coventry Electric Tramways	25,000
Credenda Tube Company	100,000
Dalziel's Atlantic Telegram Company	25,000
Dawson, Roger	15,000
Dempster, R. and J.	100,000
District Messenger Company of Paris	200,000
Domestic Telephone Company	20,000
Dover Electricity Company	50,000
Edinburgh Tramways Company	125,000
Electric and Automatic Engineering Company	10,000
Electric Anti-Corrosion Company	6,000
Electric Construction Company	400,000
Electric Light Regulating Syndicate	1,000
Electric Semaphore Signal Syndicate	3,000
Electrolytic Separation Syndicate	25,000
Electro-Protector Syndicate	10,000
English Electric Carbon Company	10,000
English Electric Manufacturing Company	5,000
Europe and Azores Telegraph Company	200,000
Faraday Electrical Engineering Company	4,600
Ford-Lloyd Manufacturing Company	10,000
General Electrolytic Parent Company	24,000
Gordon and Fell	100,000
Gorseinon Electric Light Company	1,000
Gravier Dynamo Syndicate	10,000

	Capital.
Harrison, Ainslie and Co.	£100,000
Harvey Steel Company of Great Britain	180,000
Herculite and Electrical Manufacturing Company	12,000
Holcroft (Thomas) and Sons	120,000
Incandescent Electric Lamp Company	25,000
Lamina Accumulator (Elieson's British Patents) Syndicate	12,000
London and Lancashire Electric and General Engineering Co.	20,000
Marchent, Young and Co.	4,000
Mazarron Electric Light Company	15,000
Merionethshire Electric Lighting, Power and Appliance Co.	3,000
Merveilleuse Electric Arc Lamp Syndicate	15,000
Moritz, George	5,000
New Panulcillo	50,000
Newington, Priddle and Co.	7,000
North-Eastern Telephone Company	1,000
Omnibus and Tramcar Electric Lighting Company	60,000
Orme's Electric Signal Syndicate	7,500
Oswestry Electric Lighting and Power Company	10,000
Pioneer Electric Carriage Company	20,000
Printing, Telegraph & Construction Company of the Agence Havas	130,000
Pyke, Harris and Co.	30,000
Ransome (A.) and Co.	59,000
Ramsden, Camm and Co.	50,000
Redruth Electric Supply Company	10,000
Robey & Co.	300,000
Robinson (Thomas) and Son	120,000
Rugby School Electric Lighting Company	5,500
St. Martin's Electrical Manufacturing Company	500
St. Nicholas Construction Company	40,000
Salt Lake and Ogden Gas and Electric Light Company	300,000
Saxby and Farmer	25,000
Stannum Metal Company	40,000
Stephens and Co.	20,000
Statter (J .G.) and Co.	20,000
Swinburne and Co.	25,000
United Gutta-Percha and Rubber Company	50,000
Universal Electric Lighting Company	5,000
Wallis and Steevens	60,000
Waterhouse Electrical Manufacturing Company	20,000
Waterhouse Electro-Metric Syndicate	20,000
Zohrab and Bigg's English Patents	32,007

PUBLIC COMPANIES WOUND UP, DISSOLVED, &c., IN 1893.

The following are amongst the limited liability companies which have been wound up during the past year, the asterisk denoting that the company was wound up by order of the Court :—

Abell's Electrical Engineering Company.
Aladdin Primary Battery.
Arcas Plating Company.
*Art Workshops.
Birmingham Telegraph Factory.
Blakey, Emmott and Co.
Boy Messengers and Electric Call Company (business taken over by the District Messenger Service and News Company).
British Electrical Installation Contractors (business taken over by the New British Electrical Installation Contractors).
British Tanning Company.
Edinburgh Electric Supply Corporation.
Electrical Supplies and Fittings Company.
*Elmore's French Patent Copper Depositing Company.
Electrical Engineering Company of Ireland.
Electric Construction Corporation (business taken over by the Electric Construction Company).
Engineering Exchange.
Foreign Electric Date and Time Stamp Company (new Company formed with same name).
Fowler, Lancaster and Co.
Freedman Battery Company.
Gordon (J. E. H.) and Co.
Halifax Mutual Electric Light and Power Company.
Law's Electrical Appliances Company.
*London Metallurgical Company.
London Battery Company.
*Mountain's Wire Manufacturing Company.
Nottingham Electric Light and Power Company.
Panulcillo Copper Company (business taken over by the New Panulcillo).
Powditch (J. R.) and Co.
Taunton Electric Lighting Company.
Telephone Company of Ireland (business taken over by the National Telephone Company).
Telephone Company of Austria (the Company's Exchanges having been taken over by the Austrian Government).
Wenham Company.
Williamson Electrical Engineering Company.
Windsor and Eton Electric Lighting Company.
*Woodhouse and Rawson United.

The following companies have been dissolved or have ceased to exist, in most cases nothing having been done beyond registration, and no business having been commenced :—

Automatic Electrical Corporation.
Canterbury Electricity Supply Company.
Cardiff Electricity Supply Company.
Douglas Patent Block and Electric Meter Company (business taken over by the Electric Meter Company).
Dover Electricity Supply Company.
Electrical Works Construction and Maintenance Company.
Electrical Standardising, Testing, and Training Institution.
Electro-Automatic Fire Extinguishing Company.
Electric Anti-Corrosion Company.
Gloucester Electricity Supply Company.
Gordon and Fell.
Kingston-upon-Hull Electric Lighting Supply Company.
Lane Fox Electrical Company.
Leicester Electric Light and Power Company.
Loughborough Electricity Supply Company.
Manchester Electricity Supply Company.
Penzance Electricity Supply Company.
Portland Electric Light Company.
Provincial Electric Light and Power Supply.
Putney and Hammersmith Electric Light and Power Supply.
Redruth Electric Supply Company.
Stoke-on-Trent Electricity Company.
Theatre Electrical and Specialities Production Company.
Weston-Super-Mare Electricity Supply Company.
Weymouth Electricity Supply Company.

The following changes in nomenclature have been made :—

Charing Cross and Strand Electricity Supply Corporation—formerly the Electricity Supply Corporation.
Hobart Electrical Tramways Company—formerly the Hobart Tramways Company.
Okonite Company - formerly the International Okonite Company.

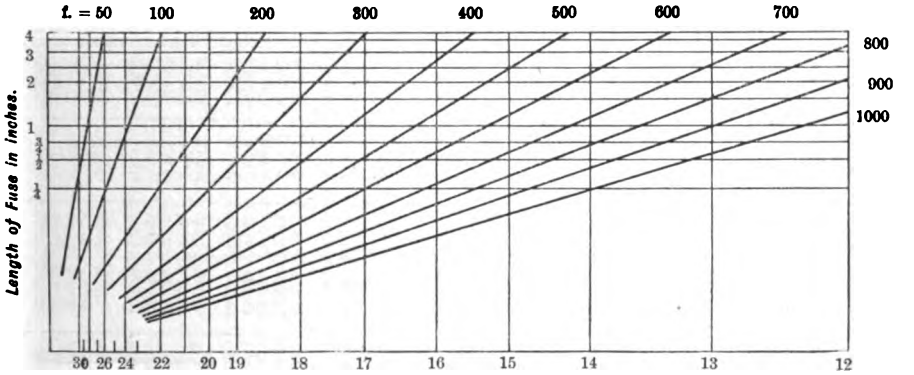
FUSE CONSTANTS AND SPARKING DISTANCES.

If for any set of terminals the fusing current for a fuse-wire of given length, diameter, and material, be known, the current necessary to fuse a wire of any other length or diameter, but of the same material, and clamped between the same terminals, may be found as the product of two constants. One of these depends on the material and the size of the terminals, and the other on the length and diameter of the wire. The first of these is given below, for six metals.

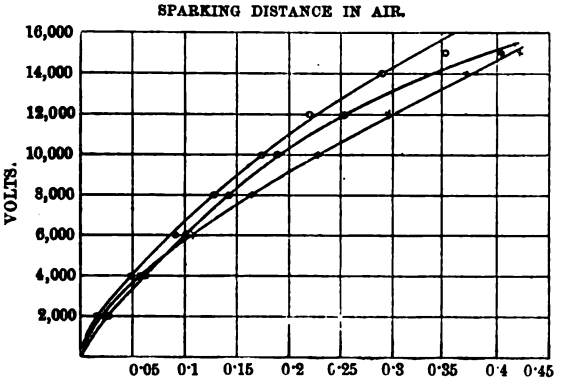
Constants for various metals for Terminals of medium size :—

Copper	0·47	Iron	0·15
Platinum	0·24	Tin	0·08
Platinoid	0·22	Lead	0·06

The second constant may be found from the following diagram. The ordinates give the length of fuse in inches, and the abscissæ give the number of the fuse-wire in Standard Wire Gauge. The diagram has been re-arranged from one devised by Mr. C. P. Feldmann.



In connection with fuses, the following curves of sparking distance in air will be found useful. They are based upon Mr. A. Siemens' experiments, the distance being given in decimals of an inch.



Readings :—•, between two Discs ; o, Hemisphere and Disc ; ×, Point and Disc ; in decimals of an inch.

The resistances in the above Table are calculated from **Dr. Matthiessen's standard** (1 mile of pure copper wire of $\frac{1}{10}$in. diameter equals 13·59 ohms or B.A. units at 15·5° C.) The resistance of pure wire increases as the temperature rises about 0·38 per cent. for each degree C., and 0·21 for each degree F.

The Diameter (d) of any copper wire equals the square root of its weight (w) in grains per foot multiplied by 6·672

$$d = 6{\cdot}672\ \sqrt{w} \quad . \quad . \quad . \quad \text{mils.}$$

The Weight (w) of any copper wire per foot in grains equals the square of its diameter (mils.), divided by 47·22

$$w = \frac{d^2}{47{\cdot}22} \quad . \quad \text{grains per foot.}$$

The Resistance (R) of any pure copper wire per mile at 15·5° C. equals the square of its diameter (mils.) divided into 53087·9

$$R = \frac{53085{\cdot}9}{d^2} \quad . \quad . \quad \text{ohms at 15·5° C. per mile.}$$

The Conductivity (C) of any copper wire is obtained by multiplying its calculated resistance (R) by 100 and dividing the product by its measured resistance (r).

$$C = \frac{R \times 100}{r} \quad . \quad . \quad . \quad . \quad \text{conductivity per cent.}$$

* It will be noticed that several of the figures in the decimal places differ slightly from figures given in other tables, but some of these differences may be accounted for by the difference of temperature at which the measurements were taken.

ELECTRIC LIGHT AND POWER CONDUCTORS.

(Inserted with the permission of the Compiler, Mr. E. W. BECKINGSALE.)

This Table is prepared for use with covered wires.

The Current column is on the basis of 1,000 amperes per square inch sectional area of the conductor.

From the column of reciprocals the *combined resistance* of any strand or circuits of different sizes can readily be found by adding the reciprocals of the respective resistances, and looking for the corresponding number in reciprocal column; when in the ohms column, exactly opposite will be found the approximate resistance required.

The coefficients under the constant, $C^2/746$, multiplied by the resistances, give the horse-power lost per 1,000 feet of conductor.

WIRING TABLES, &c.

TO BE OBTAINED OF

"The Electrician" Printing and Publishing Company, Ltd.,

SALISBURY COURT, FLEET STREET, LONDON.

THE WOODHOUSE AND RAWSON WIRING TABLES. Price—mounted and glazed and bound in cloth for pocket—2s. 6d. post free. Printed Directions how to use the Tables are issued with each Copy.

MAY'S TABLE OF ELECTRIC CONDUCTORS. For office use, printed on cardboard, with metal edges and suspender, price 1s. each, post free 2s. 2d. For the pocket, mounted on linen, in strong case, 2s. 6d. each, post free 2s. 8d.

BOULT'S COMPREHENSIVE INTERNATIONAL WIRE TABLE. Full particulars of 469 Conductors (4 Gauges), Single Wires and Cables, in English, American and Continental Units. Price, cloth, 6s. 6d. post free all over the world. Paper covers 4s. 6d., post free.

BADT'S INCANDESCENT WIRING HANDBOOK (with Tables). Price 4s. 6d. post free (U.K.).

THE WIRING SLIDE RULE (Trotter's Patent), by which can be found at once :—1. Size of Cable ; 2. Length of Cable ; 3. Current Cable will carry ; 4. Current Density ; 5. Maximum Current ; 6. Resistance in Ohms ; 7. Sectional Area in Square Inches. Full printed Instructions supplied with each Rule. For the pocket, price 2s. 6d., post free ; in cloth case, 3s. 6d.; in morocco case, 4s. 6d.

VIRTUAL RESISTANCE, &c., OF CONDUCTORS WITH ALTERNATE CURRENTS.—(MORDEY.)

The following Table shews the limits of diameter of solid or stranded conductors at which the virtual resistance effect becomes objectionable. It gives also the current that may be carried by the safe diameters, and the corresponding watts at 2,000 and 100 volts.

Diameter of copper.		Area of cross-section.		Increase over ordinary resistance.	Current at 450 amperes per sq. in.	Watts at 2,000 volts.	Watts at 100 volts.	∼ per second.
mm.	Inch.	Sq. mm.	Sq. in.					
10	0·3937	78·54	0·12	Less than $\frac{1}{100}$ p.c.	55 0	110,000	5,500	80
15	0·5907	176·7	0·274	$2\frac{1}{2}$ p.c.	133·0	266,000	13,300

Data for copper conductors working with 2,000 volts pressure at the primary terminals of the transformers.

The following particulars refer to conductors for primary circuits working at 2,000 volts, and show the sizes for various numbers of lamps giving a loss of 1 per cent. per mile run.

Transformers taken at 95 per cent. efficiency.

To allow 1 per cent. loss of pressure per mile of conductor, the primary current density should be 450 amperes per square inch. This density also gives 1·15 per cent. loss per 100 yards, for 100 volt circuits.

PRIMARY CONDUCTORS FOR ANY GIVEN NUMBER OF 60-WATT LAMPS ON SECONDARY.

Sectional area, in square inches = number of lamps × 0·00007.
Weight per mile in lbs. = ,, ,, × 1·44.
Resistance per mile, in ohms = 630 ÷ number of lamps.

The following conductors comply with the above rule, and none of them is affected by the virtual resistance effect :—

Number of lamps.	B.W.G. No.	Diameter.	Sectional area.	Weight per mile.	Resistance per mile.
		Inch.	Square inch.	lbs.	Ohms.
100	13	0·098	0·007088	144	6·3658

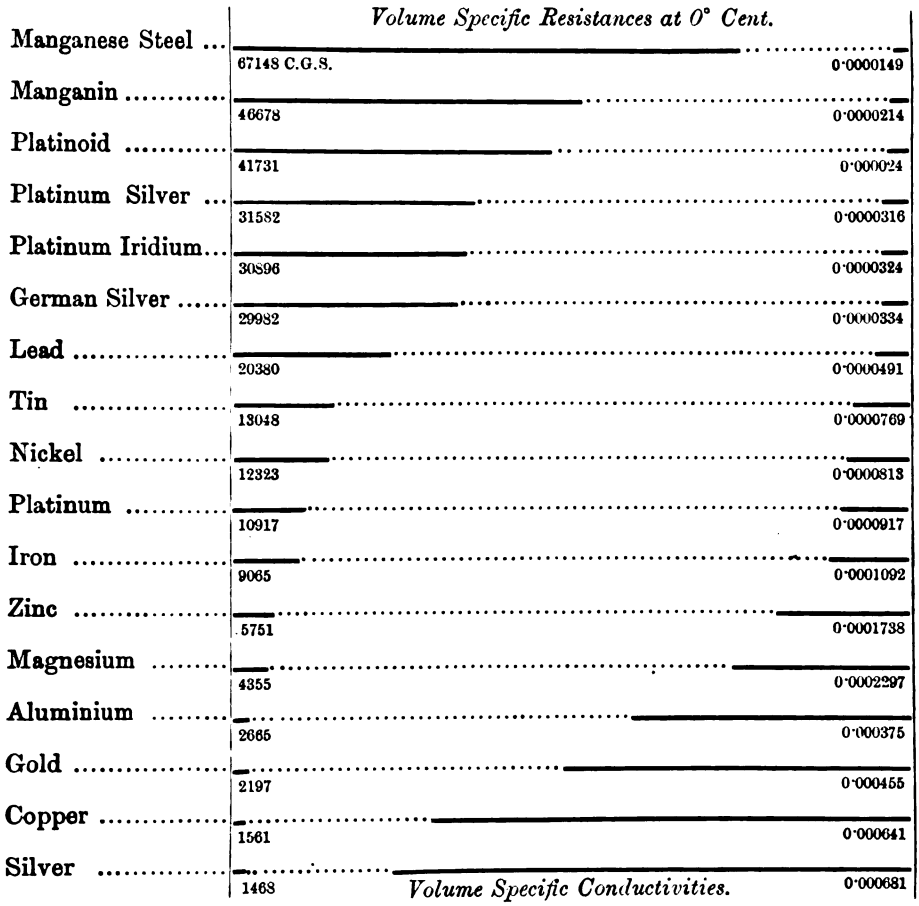
RESISTANCES AND CONDUCTIVITIES OF METALS AND ALLOYS, AT 0°C.

(Specially Prepared for "The Electrician" Electrical Trades' Directory.)



The length of the lines in this table is based upon the determinations of volume specific resistances by Profs. Dewar and Fleming. "Volume specific resistance" is defined as the resistance between opposite faces of a centimetre cube of the material in C.G.S. units. These values are marked under the lines; the value for manganese steel being 67148, and for silver 1468. If these numbers are divided by 100,000 the quotient is the resistance in *ohms* of a wire of the material one metre long and one square millimetre in section. The lengths of the resistance lines of these two metals in the diagram are 67·1 millimetres and 1·5 millimetres respectively. The lengths of the lines representing "volume specific conductivities" are the reciprocals of the corresponding resistances. Wires of different metals, all of the same diameter, and of lengths equal to or multiples of the lengths of these conductivity lines, will all be of the same resistance. With wires of different metals, all of the same length and of the same resistance, the sectional areas must be proportional to the length of the resistance lines.

* Becquerel's extension of Faraday's law showed that the electro-chemical equivalent of an element is proportional to its chemical equivalent. The latter is equal to its combining weight, and not to atomic weight ÷ valency, as defined by Thompson, Hospitalier and others who have copied their tables. For example, the ferric salt is an exception to Thompson's rule, as are sesqui salts in general.

NOTES ON ILLUMINATION.

For indoor use, the illumination produced by a standard candle at a distance of 1 foot is suitable for most ordinary purposes. Mr. Preece's rule is :—One 16-candle lamp, 8 feet high, for every 8 feet square, or 64 square feet. The colour of the ceiling and walls so greatly affects the illumination that definite rules are of doubtful value. The reflection from walls and ceilings of a fairly light colour will double the illumination by reflection. Mr. Preece's rule works out to 1 watt per square foot ; the colour of the walls may allow this to be reduced to half a watt, or may necessitate an increase to more than 2 watts per square foot.

Arc lamps 18 feet above the ground, taking 10 amperes, give a maximum illumination of about half a candle at 1 foot distance. Such lamps, arranged 120 feet apart, give a minimum illumination equal to about ·03 candle at 1 foot. This is considered good for street lighting.

One candle at 1 foot is equivalent to four candles at 2 feet, or to nine candles at 3 feet, &c.; but to say off-hand what illumination would be produced by a 16-candle lamp at a distance of 8 feet is rather puzzling at first. In terms of the unit produced by one candle at 1 foot, the illumination would be $16/8^2 = \frac{1}{4}$.

The following table will be found convenient, each of the combinations being approximately equivalent to one candle at 1 foot :—

Candle-power.	Ft.	in.	Candle-power.	Ft.	in.
1	1	0	64	8	0
4	2	0	100	10	0
8	2	10	144	12	0
9	3	2	200	14	2
16	4	0	400	20	0
20	4	6	600	24	6
30	5	6	1000	31	8
50	7	1	1600	40	0

The illumination at any point produced by a light radiating uniformly in all directions may be found as follows:—Let A B be the height of the lamp from the ground, A C the distance of the given point from the foot of the lamp-post, and *c.p.* the candle-power of the lamp :

$$i = \frac{A\,B \times c.p.}{A\,C^2}$$

where i is the illumination in units of one candle at 1 foot.

In order to adjust the height of A B so that the illumination at C may be a maximum, A C should be equal to A B $\times \sqrt{2}$.

When a number of lamps of given candle-power, and radiating light uniformly in all directions, are arranged in a row, as in street lighting, the row being either straight or obtusely zig-zag, the resultant illumination will depend on their height and on their distance apart. In the following table the height of the lamps is taken as 1, and the distance is measured in terms of the height. The maximum at the foot of each lamp, and the minimum illumination midway between two lamps is given in terms of the maximum. The variation between the maximum and minimum is given as a percentage of the maximum.

Distance.	Maximum.	Minimum.	Variation.	Distance.	Maximum.	Minimum.	Variation.
1	1·98	1·93	2·25%	3	1·07	·36	64·0%
2	1·22	·78	36·0%	6	1·01	·063	93·7%

Diffused Reflection and Transmission of Light.—The following reflection, transmission, and absorption of various substances are taken from a Paper read by Dr. Sumpner before the Physical Society :—

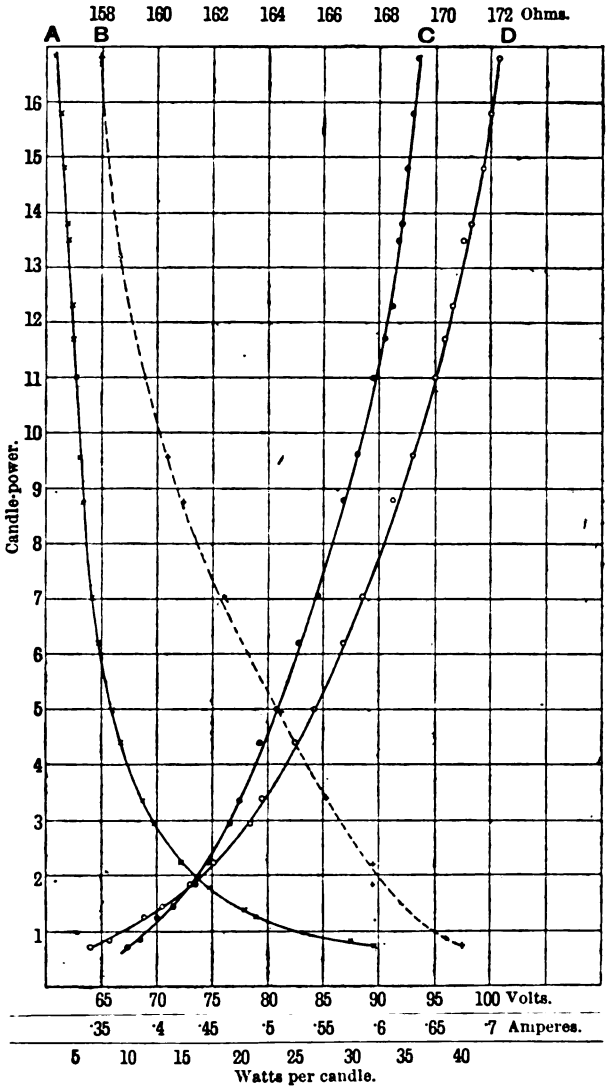
Glow Lamps.—The accompanying diagram may be taken as representing the relation of the current, volts, candle-power and watts per candle, of an average 16-c.p. 100-volt lamp of the Edison-Swan Company's make. It will be observed that a difference of one volt at about 100 volts makes a difference of about one candle-power. Or 1 per cent. difference in volts, makes a difference of 6¼ per cent. in candle-power.



Curves showing relation beween candle-power and volts, amperes, resistance, and watts per candle.

A Watts and candle-power. **C** Current.
B Resistance. **D** Volts.

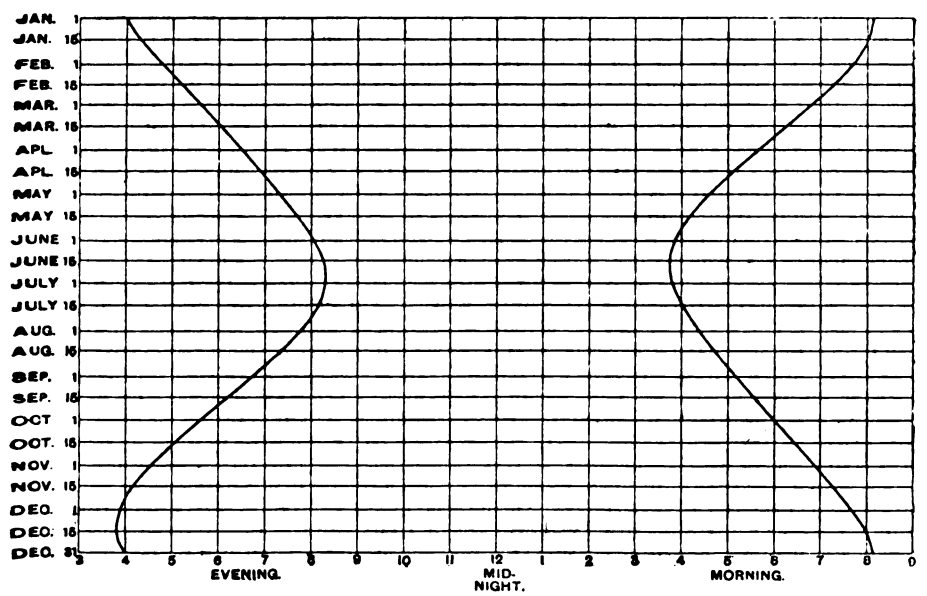
TABLE SHOWING HOURS OF LIGHTING.

Hours of lighting.	Period of the year during which light is required at these hours.	Total number of hours of lighting per annum.
6 a.m. till daylight..		250 hours
Dusk „ 5 p.m.	Oct. 1 to March 22	83 „
„ „ 6 p.m.	Sept. 21 „ „ 14	226 „
„ „ 6:30 p.m.	„ 8 „ April 1	320 „
„ „ 7 p.m.	Aug. 25 „ „ 19	430 „
„ „ 7:30 p.m.	„ 10 „ May 7	560 „
„ „ 8 p.m.	July 23 „ „ 28	730 „
„ „ 8:30 p.m.	All the Year	900 „
„ „ 9 p.m.	„ „ „	1,090 „
„ „ 10 p.m.	„ „ „	1,455 „
„ „ 11 p.m.	„ „ „	1,820 „
„ „ midnight	„ „ „	2,185 „
„ „ 2:15 a.m.	„ „ „	3,000 „
All night	„ „ „	4,380 „

These results are shown graphically in the accompanying diagram :—



The space between the curved lines represents the time during which light is required. The horizontal lines show the months of the year. The vertical lines show the hours. For further information see *The Electrician*, January 19, 1894.

METRICAL SYSTEM OF WEIGHTS AND MEASURES.

THE Metrical System is based upon the length of the fourth part of a terrestrial meridian. The ten-millionth part of this arc is called a *Metre*, and is the unit of length. The cube of the tenth part of the metre was adopted as the unit of capacity, and denominated a *Litre*. The weight of a litre of distilled water at its greatest density was called a *Kilogramme*, of which the thousandth part, or *Gramme*, was adopted as the unit of weight. The multiples of these, proceeding in decimal progression, are distinguished by the employment of the prefixes *deca*, *hecto*, *kilo*, and *myria*, and the subdivisions by *deci*, *centi*, and *milli*.

MEASURES OF LENGTH (UNIT METRE).

Equal to	Inches.	Feet.	Yards.	Miles.

EXPLANATORY NOTES.—France, Belgium, Italy, Greece, and Switzerland constitute what is known as the "Latin" Union, and their coins are alike in weight and fineness, occasionally differing, however, in name. The same system has been in part adopted by Spain, Servia, Bulgaria, Russia, and Roumania, but they have not joined the Union. Francs and centimes of France, Belgium, and Switzerland are respectively designated lire and centesimi in Italy; drachmai and lepta in Greece; dinars and paras in Servia; pesetas and centimos in Spain; leys and banis in Roumania; leva and stotinkis in Bulgaria. Similarly the Scandinavian countries, Norway, Sweden, and Denmark, employ coins of the same weight and fineness, their names being also alike. Most of the South American States possess a standard coin, equal in weight and fineness to the silver five-franc piece, generally termed a "peso." In Hayti the corresponding coin is a "gourde."

In all British Colonies, English money of every denomination is current. The exchange value of the money of those countries indicated by a * is determined by the rate of exchange for the day. The rate given in the daily papers generally represents the number of the standard coins (those printed in italics) that are equivalent to one sovereign. The Spanish rate is given in terms of the old dollar (=2 escudos). The value of other silver coins is approximately determined by the market value of silver, and must therefore be sought in one of the columns headed "Intrinsic Value with Silver at per Troy Ounce." The exchange value of the rupee depends on the rate for "India Council Bills." In "bimetallic" countries pure gold is generally taken as being worth 15½ times its weight of pure silver. This proportion corresponds to giving standard silver a constant value of 60½d.

IMPORT DUTY LEVIABLE ON ELECTRICAL MACHINERY AND APPARATUS

IN THE UNDERMENTIONED COLONIES.

Revised for this DIRECTORY, *up to December, 1893, by the Commercial Department of the Board of Trade.*

Colony, and Tariff Classification.	Rates of Duty.
BARBADOES—	
All kinds	Free.
BRITISH GUIANA—	
All kinds	Free.
CANADA—	
Glass Telegraph and Lightning Rod Insulators	5cts. per doz., and 30 per cent. *ad val.*
Electric Light Shades, Globes (not being incandescent light globes) and Lamps	30 per cent. *ad val.*
Telephones and Telegraph Instruments, Telegraph, Telephone and Electric Light Cables, Electric and Galvanic Batteries, Electric Motors and Apparatus for Electric Lights, including Incandescent Light Globes and Insulators of all kinds (N.E.S.)	25 per cent. *ad val.*
Electric Arc Light Carbons or Carbon Points not exceeding 12in. in length	$2·50 per 1,000 and so in proportion for greater or less lengths.
Steam Engines (other than portable), Boilers and Machinery composed wholly or in part of iron and steel	30 per cent. *ad val.*
Portable Machines or Steam Engines and parts thereof	35 per cent. *ad val.*
CAPE OF GOOD HOPE—	
Materials for use in construction of telegraph lines	Free.
Other	12 per cent. *ad val.*
CEYLON—	
Magneto-electric Engines, their boilers, generators, fittings, connections, and gearing	Free.
Other	6½ per cent. *ad val.*
INDIA—	
All kinds	Free.
JAMAICA—	
All kinds	Free.
MAURITIUS—	
All kinds	7½ per cent. *ad val.*, with a surtax of 10 per cent. on the duty so leviable.
NATAL—	
Machinery, or component parts thereof, to be driven by steam, water or animal power	Free.
Other	5 per cent. *ad val.*
NEWFOUNDLAND—	
Machinery and Parts of Machinery	10 per cent. *ad val.*
Patented Machinery (for new industries in the Colony) which cannot be manufactured in the Colony	Free.
Other	25 per cent. *ad val.*
NEW SOUTH WALES—	
China and Porcelain Ware	15 per cent. *ad val.*
Other	10 per cent. *ad val.*

Digitized by Google

Colony and Tariff Classification.	Rates of Duty.
NEW ZEALAND—	
Electric Machinery and Appliances, including Electro-motors and Hand Dynamos, Cells for batteries, &c.	Free.
Engines for electric lighting machinery	20 per cent. *ad val.*
Electric Globes, Electric Brackets, Electroliers, &c., being fittings for distributing the light	Free.
Telephones	Free.
Electrical apparatus for surgeons' use	Free.
Electric Batteries and Magneto-Electric Machines	15 per cent. *ad val.*
Electric Bell Fittings, except cells for batteries	20 per cent. *ad val.*
Earthen and Stone Ware, China and Porcelain	20 per cent. *ad val.*
QUEENSLAND—	
Machinery for Telegraphic Purposes	Free.
Gas and Portable Engines	Free.
Other	15 per cent. *ad val.*
SOUTH AUSTRALIA—	
Telephones	Free.
Engines, portable and gas	Free.
Other Engines and parts thereof	25 per cent. *ad val.*
Other Machinery	20 per cent. *ad val.*
Electric Bells and Bell Indicators	25 per cent. *ad val.*
Otherwise	20 per cent. *ad val.*
Glass Ware, Globes, and Carbons for electric lighting	15 per cent. *ad val.*
Brown Earthenware and Stone Ware	20 per cent. *ad val.*
Other Earthenware and China Ware	15 per cent. *ad val.*
Other fittings or appliances unenumerated	10 per cent. *ad val.*
STRAITS SETTLEMENTS—	
All kinds	Free.
TASMANIA—	
Engine fittings	5 per cent. *ad val.*
Engines and Machinery of all kinds (except hand machines)	7½ per cent. *ad val.*
Other	15 per cent. *ad val.*
TRINIDAD AND TOBAGO—	
All kinds	Free.
VICTORIA—	
China Ware, Earthenware, and Porcelain, being telegraphic materials	Free.
Machines and Machinery for telegraphic purposes (but not including the motive power thereof)	Free.
Electric Fittings:—viz., Arc lamps without globes, carbons, incandescent lamps, automatical resisters, transmitters or transformers, and storage batteries	Free.
Lightning Conductors	Free.
Screws for connecting electric wires of telegraph or bell fittings, or batteries, or used in manufacture of same	Free.
Machinery and Engines of all kinds (including fittings for pipes and tubes)	35 per cent. *ad val.*
Electroliers	35 per cent. *ad val.*
Portable Engines	25 per cent. *ad val.*
WESTERN AUSTRALIA—	
Machinery and parts	5 per cent. *ad val.*
Telegraph and Telephone materials, including instruments	5 per cent. *ad val.*
Earthen, Stone, and China Ware	15 per cent. *ad val.*
Other	15 per cent. *ad val.*

NOTE.—In the tariffs of several of the Colonies, dealt with in this table, there is no separate reference to *electrical* machinery and apparatus. In such cases the rates of duty are given for those classes of articles with which the various kinds of electrical machinery and apparatus would probably be grouped, but it is not always certain how the tariff would be interpreted by the local customs authorities.

THE FRENCH CUSTOMS TARIFF.

THE following extracts from the French Customs Tariff, which came into definite operation on the 1st February, 1893, relate to Electrical Goods. It will be seen that no reference is made to a tax on Insulated Cables, Telephonic Apparatus, Switches, &c. We are informed by the London Chamber of Commerce that the Minimum Tariff will apply to British products:—

Tariff No.	ARTICLE.	General tariff per 100 kilogrammes.	Minimum tariff per 100 kilogrammes.
		francs.	francs.
191	GRAPHITE OR PLUMBAGO	Exempt.	
193	BITUMEN	dito	
200	PLATINUM AND GOLD—		
	(*a*) Ore	dito	
	(*b*) Crude; in mass, bars, ingots, powder, broken up articles	10	10
	(*c*) *Thread, Sheet, or Wire.*—Fine drawn, simply laminated, in bars of at least 5mm. thickness, in sheets of at least 1mm. thickness, or as wire of at least 2mm. diameter	10	10
221	COPPER—		
	(*a*) Ore	Exempt.	
	(*b*) *Pure or alloyed with Zinc or Tin*—		
	Crude; in mass, bars, pig, or sheet	dito	
	Laminated, or beaten into bars or plates	13	10
	In wire of any dimension (polished or unpolished) other than gilded or silvered	13	10
224	ZINC—Sheet	4	4
238	SULPHURIC ACID	Exempt.	
239	LEAD OXIDES—		
	(*a*) Minium	5	2
	(*b*) Litharge and other oxides	5	2
302	CARBONS PREPARED FOR ELECTRIC LIGHTING	75	50
349	GLASS INSULATORS	6	4.5
361	INCANDESCENT ELECTRIC LAMPS, capped (*munies de leur monture*)	400	350
361 (bis.)	INCANDESCENT ELECTRIC LAMPS, uncapped	800	700
475	TUBES AND CONDUITS OF BITUMENED PAPER	1.25	1
504	LARGE CLOCKWORK. Clock movements, ditto telegraph instruments, counters, and every so-called clockwork movement, except that of a watch, complete or incomplete, with or without motor systems	100	75
505	ELECTRICITY COUNTERS	100	75
510	STATIONARY STEAM ENGINES, HEAT, GAS, PETROLEUM, HOT AIR, AND COMPRESSED AIR ENGINES—		
	250 kilogrammes and more	18	12
	Less than 250 kilogrammes	30	20
511	SEMI-PORTABLE STEAM ENGINES	17	13
524	DYNAMO-ELECTRIC MACHINES—		
	1,000 kilogrammes and upwards	30	20
	50 kilogrammes to 1,000 kilogrammes	45	30
	10 kilogrammes up to and less than 50 kilogrammes	100	80
526	STEAM BOILERS, iron or steel, simple or furnished with feed-water heaters, internal furnaces, but without tubes	12	9
526 (bis.)	STEAM BOILERS, iron or steel, tubular or semi-tubular, that is to say, having iron, steel, copper, or brass tubes	18	14
536	ARMATURES OF DYNAMO ELECTRIC MACHINES and separate parts, such as solid or hollow metal bobbins wound with insulated copper wire; worked copper pieces, weighing less than 1 kilogramme, numbered and marked, mounted or unmounted; intended for electric apparatus and arc lamps	100	75
576	LEAD PIPING, and all other kinds of lead work	4	3
576 (bis.)	ELECTRIC ACCUMULATORS	17	13
578	WORKED ZINC, ordinary, united or stamped	12	8
620	INDIA RUBBER AND GUTTA PERCHA MATERIALS—		
	(*a*) India rubber sheet; pure unvulcanised and vulcanised rubber thread	60	40
	(*b*) Belts, tubes, valves, and other India rubber and gutta percha work, pure or mixed, soft or hard, combined or uncombined with cloth or other material	90	70
634	OPTICAL, MATHEMATICAL, ASTRONOMICAL, AND OTHER INSTRUMENTS OF PRECISION	Exempt.

THE McKINLEY TARIFF ACT.

THE following comparison of the Tariff established in the United States by the passing of the McKinley Act, with the previous duty, will be of interest to our readers. The List is made up from various sources, and we are informed by the American Consular Office that it is reliable. The rates given below are now under revision by the American House of Representatives, and a new Tariff will probably come into operation in June, 1894.

	PREVIOUS RATE.		M'KINLEY RATE.
Chromic acid	15 %	...	6c.
Sulphuric acid or oil of vitriol	Free	...	¼c.
Alumina, alum, alum cake, patent alum, sulphate of alumina, and aluminous cake and alum in crystals or ground	6/10c.	...	6/10c.
Ammonia.—Carbonate	20 %	...	1¾c.
Muriate or salammoniac	10 %	...	¾c.
Sulphate	20 %	...	½c.
Blue vitriol or sulphate of copper	3c.	...	2c.
Borax.—Crude or borate of soda or borate of lime	3c.	...	3c.
Refined borax	5c.	...	5c.
Copperas or sulphate of iron	3/10c.	...	3/10c.
Castor oil, per gallon	80c.	...	80c.
Cottonseed oil, per gal. of 7½lb. weight	25c.	...	10c.
Flaxseed, or linseed and poppyseed oil: raw,	25c.	...	32c.
boiled or oxidised, per gal. of 7½lb. weight	Free	...	35 %
Varnishes.—Gold size or Japan	40 %	...	35 %
Other varnishes	40 %	...	$1.32
In addition, on spirit varnishes for the alcohol contained therein, per gallon	3c.	...	3c.
Lead Products.—Litharge, per lb.	3c.	...	3c.
Red lead, per lb.	3c.	...	3c.
Potash.—Bichromate and chromate, per lb.	3c.	...	3c.
Soda —Bichromate and chromate, per lb.	25 %	...	25 %
Earthenware, stoneware, crucibles, plain	60 %	...	60 %
China and porcelain	55 %	...	55 %
If plain white, not decorated	55 %	...	60 %
If ornamented or decorated	45 %	...	60 %
Glass.—Flint, pressed, not decorated	45 %	...	60 %
Glass.—Decorated	45 %	...	45 %
Chemical glassware	45 %	...	60 %
Blown glassware	45 %	...	60 %
Porcelain or opal	45 %	...	60 %
Lenses			
Iron and Steel.—Iron in pigs, kentledge, speigeleisen, ferro-manganese, fello-silicon, and scraps, but nothing shall be deemed scrap iron or scrap steel except waste or refuse iron or steel fit only to be re-manufactured, per lb.	3/10c.	...	3/10c.
Bar iron, comprising flats not less than 1in. wide ⅜in. thick, per lb.	8/10c.	...	8/10c
Round iron, ¾in. diameter and square iron ¾in. square, per lb.	1c.	...	9/10c
Bar, round and flats less than above, per lb.	1 1/10c.	...	1c.
Round iron less than 7/16in. diameter, and bars or shapes of rolled iron not otherwise provided for, per lb.	1 2/10c.	...	1 1/10c
Iron bars, blooms, billets made by charcoal fuel, per ton	$22	...	$22
Iron structural shapes, per lb.	1¼c.	...	9/10c
Plate iron not thinner than No. 10 wire gauge valued at 1c. per lb.	1¼c.	...	5/10c.
Not above 1 4/10c. per lb.	1¼c.	...	65/100c
Not above 2c. per lb.	1¼c.	...	8/10c.
Not above 3c. per lb.	1¼c.	...	1 9/10c.
Not above 4c. per lb.	1¼c.	...	1½c.
Not above 7c. per lb.	1¼c.	...	2c.

Iron and Steel—(*continued*).	PREVIOUS RATE.		M'KINLEY RATE.
Not above 10c. per lb.	$1\frac{1}{4}$c.	...	$2\frac{8}{10}$c.
Not above 13c. per lb.	$1\frac{1}{4}$c.	...	$3\frac{1}{2}$c.
Above 13c. per lb.	$1\frac{1}{4}$c.	...	45 °/₀
Provided that all plate iron or steel thinner than number ten shall pay duty as iron or steel sheet.			
Forgings of iron or steel, per lb.	$2\frac{1}{2}$c.	...	$2\frac{3}{10}$c.
Provided that no forgings shall pay a less duty than 45 per cent. *ad valorem.*			
Plates of iron or steel, coated with tin or lead, per lb.	1c.	...	$2\frac{2}{10}$c.
Ingots, blooms, slabs, shafting, castings, valued at 4c. or less, per lb.	45 °/₀	...	45 °/₀
At 1c. or less, per lb.	$\frac{4}{10}$c.	...	$\frac{4}{10}$c.
1c. and not above $1\frac{4}{10}$c., per lb.	$\frac{1}{2}$c.	...	$\frac{1}{2}$c.
$1\frac{4}{10}$c. and not above $1\frac{8}{10}$c., per lb.	$\frac{7}{10}$c.	...	$\frac{8}{10}$c.
$1\frac{8}{10}$c. and not above $2\frac{2}{10}$c., per lb.	$\frac{9}{10}$c.	...	$\frac{9}{10}$c.
$2\frac{2}{10}$c. and not above 3c., per lb.	$1\frac{2}{10}$c.	...	$1\frac{2}{10}$c.
Above 3c. and not above 4c., per lb.	$1\frac{6}{10}$c.	...	$1\frac{6}{10}$c.
Above 4c. and not above 7c., per lb.	2c.	...	2c
Above 7c. and not above 10c., per lb.	$2\frac{3}{4}$c.	...	$2\frac{1}{10}$c.
Above 10c. and not above 13c., per lb.	$3\frac{1}{4}$c.	...	$3\frac{1}{2}$c.
Above 13c. and not above 16c., per lb.	$4\frac{2}{10}$c.	...	$4\frac{2}{10}$c.
Above 16c., per lb.	$3\frac{1}{4}$c.	...	7c.

	PREVIOUS RATE.		M'KINLEY RATE.
Wire rods, per lb.	$\frac{6}{10}$c.	...	$\frac{6}{10}$c.
Wire, not smaller than No. 10 wire gauge, per lb.	$1\frac{1}{2}$c.	...	$1\frac{1}{4}$c.
Smaller than No. 10, not smaller than No. 16, per lb.	2c.	...	$1\frac{3}{4}$c.
Smaller than No. 16, not smaller than No. 26, per lb.	$2\frac{1}{2}$c.	...	$2\frac{1}{4}$c.
Smaller than No. 26, per lb.	3c.	...	3c.
Any of above covered with cotton, silk, &c., corset wire (in addition) per lb.	4c.	...	5c.
*Flat steel wire, per lb.	45 °/₀	...	50 °/₀
Boiler tubes, per lb.	3c.	...	$2\frac{1}{2}$c.
Cast-iron pipe, per lb.	1c.	...	$\frac{9}{10}$c.
Steel plates, stereotype, electrotype, engraved, or lithographed	25 °/₀	...	25 °/₀
Aluminium, crude and alloys	Free	...	15 °/₀
Argentina albata or German silver, per lb.	25 °/₀	...	25 °/₀
Brass bars or pigs, old brass, yellow metal fit only for remanufacture, per lb.	$1\frac{1}{2}$c.	...	$1\frac{1}{2}$ °/₀
Copper, old, for remanufacture, per lb.	3c.	...	1c.
In plates, bars, or ingots not manufactured	4c.	...	$1\frac{1}{4}$c.
In rolled plates, rods, pipes, sheathing	35 °/₀	...	35 °/₀

* *General Provisions.*—No allowance or reduction of duties for partial loss or damage in consequence of rust or of discoloration shall be made upon any description of iron or steel, or upon any article wholly or partly manufactured of iron or steel, or upon any manufacture of iron and steel.

All metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation, or converted, cast, or made from iron or its ores, by the crucible, Bessemer, Clapp-Griffiths, pneumatic, Thomas-Gilchrist, basic, Siemens-Martin, or open-hearth process, or by the equivalent of either, or by a combination of two or more of the processes, or their equivalents, or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable-iron castings, shall be classed and denominated as steel.

No article not specially provided for in this Act, wholly or partly manufactured from tin plate, terne plate, or the sheet, plate, hoop, band, or scroll iron or steel herein provided for, or of which such tin plate, terne plate, sheet, plate, hoop, band, or scroll iron or steel shall be the material of chief value, shall pay a lower rate of duty than that imposed on the tin plate, terne plate, or sheet, plate, hoop, band, or scroll iron or steel from which it is made, or of which it shall be the component thereof of chief value.

On all iron or steel bars or rods of whatever shape or section, which are cold-rolled, cold-hammered, or polished in any way in addition to the ordinary process of hot-rolling or hammering, there shall be paid one-fourth of one cent per pound in addition to the rates provided in this Act; and on all strips, plates, or sheets of iron or steel of whatever shape, other than the polished, planished, or glanced sheet-iron or sheet-steel hereinbefore provided for, which are cold-rolled, cold-hammered, blued, brightened, tempered, or polished by any process to such perfected-surface finish, or polish better than the grade of cold-rolled, smooth only, hereinbefore provided for, there shall be paid one and one-fourth cents per pound in addition to the rates provided in this Act upon plates, strips, or sheets of iron or steel of common or black finish; and on steel circular saw-plates there shall be paid one cent per pound in addition to the rate provided in this Act for steel saw-plates.

The Free List.*

Chemical or manufacturing purposes not specially provided for. Amber, unmanufactured or crude gum. Antimony ore, crude sulphide of. Asbestos, unmanufactured. Beeswax (20 %). Bismuth. Books, engravings, photographs, bound or unbound etchings, maps and charts, which shall have been printed and bound or manufactured more than twenty years at the date of importation. Books and pamphlets printed exclusively in languages other than English; also books and music in raised print (25 %). Books, engravings, photographs, etchings (bound or unbound), maps and charts imported by authority or for the use of the United States, or for the use of the library of Congress. Books, maps, lithographic prints and charts, specially imported, not more than two copies in any one invoice in good faith, for the use of any society incorporated or established for educational, philosophical, literary, or religious purposes, or for the encouragement of the fine arts, or by any college, academy, school, or seminary of learning in the United States, in its own behalf or in behalf of any of its professors or teachers, subject to such regulations as the Secretary of the Treasury shall prescribe. Books or libraries, or from foreign countries. Burgundy pitch. Catgut. Gutta-percha, crude. Indiarubber, crude, and milk of, scrap or refuse Indiarubber. Magnesium. Magnets. Manganese, oxide and ore of. Manuscripts. Minerals, crude, or not advanced by manufacture. Models of inventions and of other improvements in the arts, including patterns for machinery. Paraffin. Philosophical and scientific apparatus instruments, and preparations; statuary, casts of marble, bronze, alabaster or plaster of Paris; paintings, drawings, and etchings, specially imported in good faith for the use of any society or institution incorporated or established for religious, philosophical, educational, scientific, or literary purposes, or for encouragement of the fine arts, and not intended for sale. Platina, in ingots, bars, sheets and wire. Platinum, unmanufactured, and apparatus of platinum for chemical uses. Professional books, implements, instruments and tools of trade, occupation or employment, in the actual possession at the time of persons arriving in the United States. Wax, vegetable or mineral. Philosophical and scientific apparatus brought by professional artists, lecturers or scientists arriving from abroad for use by them temporarily for exhibition, photographic pictures for exhibition.

The Reciprocity Clauses.

On and after the first day of March, eighteen hundred and ninety-one, all articles of foreign manufacture, such as are usually or ordinarily marked, stamped, branded, or labelled, and all packages containing such or other imported articles, shall, respectively, be plainly marked, stamped, branded, or labelled in legible English words, so as to indicate the country of their origin; and unless so marked, stamped, branded, or labelled shall not be admitted to entry. Machinery for repair may be imported into the United States without payment of duty, under bond, to be given in double the appraise value thereof, to be withdrawn and exported after said machinery shall have been repaired; and the Secretary of the Treasury is authorised and directed to prescribe such rules and regulations as may be necessary to protect the revenue against fraud, and secure the identity and character of all such importations when again withdrawn and exported, restricting and limiting the export and withdrawal to the same port of entry where imported, and also limiting all bonds to a period of time of not more than six months from the date of the importation.

* The rates quoted within brackets are the old rates.

POST OFFICE REGULATIONS.

INLAND RATES OF POSTAGE.

LETTERS.

The prepaid rates of postage are as follows :—

Not above 1 oz.....	1d.	Above 2 oz. but not above 4 oz.	2d.
Above 1 oz. but not above 2 oz.....	1½d.	*and so on at the rate of ½d. for every additional 2oz.*	

A letter posted unpaid is chargeable on delivery with double postage ; if insufficiently paid, with double the deficiency.

No letter may exceed 18 inches in length, 9 inches in width, or 6 in depth, unless it be sent to or from a Government Office.

REGISTRATION.

Any postal packet (parcels included), can be registered on the payment of a fee of 2d. in addition to the postage, both of which must be prepaid by means of embossed or adhesive stamps upon the cover. Such postal packet requires to be handed over the counter (and a receipt obtained) half-an-hour before the closing of the box for ordinary letters. Too-late fee 4d. The department, under certain regulations, makes good the value of the contents to the following extent, viz., to £5 if paid the registration fee only, if paid an insurance fee of an additional 1d. for £10 and a 1d. for each £5 up to £50. *Postal packets containing money* (i.e., *Coin, Bank Notes, Money or Postal Orders, Bills, Cheques, Bonds, Coupons, &c.*) *will, however, only get the benefit of this regulation if enclosed in the special registered-letter envelopes sold by the Post Office.*

POST CARDS, WRAPPERS, STAMPED ENVELOPES, &c.

Official Post Cards, impressed with halfpenny stamp, double or reply Post Cards impressed with a halfpenny stamp on each portion of them, and private Cards impressed at the Office of Inland Revenue with halfpenny stamps, may be transmitted between places in the United Kingdom with letters printed or written upon the back. *Adhesive Stamps are not accepted in payment of the postage.* Inland Post Cards are sold at the following prices :—Stout : One, ¾d. ; two, 1½d. ; three, 2d. ; four, 2½d. ; five. 3d. ; six, 3½d. ; seven, 4½d. ; eight, 5d. : nine, 5½d. ; ten, 6d. : 100, 5s. Thin : One, ¾d. ; two, 1½d. ; three, 1¾d. ; four, 2¼d. ; five, 2¾d. ; six, 3½d. ; seven, 4d. ; eight, 4½d. ; nine, 5d. ; ten, 5½d. ; 240, 11s. Foreign 1d. each. Reply Cards 2d. each. The front side of Post Cards is for the address only ; nothing else must be written, printed, or otherwise impressed on it or the stamp. On the reverse side any communication of a letter or otherwise may be written or printed. Conditions on which private cards are impressed with a halfpenny stamp can be ascertained at the Office of Inland Revenue. Adhesive stamps, except for late fee, are not accepted in payment of the postage.

Halfpenny Newspaper Wrappers at the rate of seven for 4d., and 1d. Wrappers eight for 8½d.

Stamped Envelopes at 2s. 2d. for 24, 1s. 10d. for 20, and commercial quality 1s. 9d. for 20.

BOOK POST.

The prepaid postage of a book packet is one halfpenny for every 2 oz. or part of 2 oz. If it be posted unpaid the charge is double that amount ; if partly paid double the deficiency.

The following may be sent by book post :—Books and other literary publications, photographs, prints, and drawings on paper ; and, generally, any matter wholly printed on paper or other substance in ordinary use for printing, and any written matter not being of the nature of a letter,* A book packet may also contain anything necessary for the safe transmission of any of the before mentioned articles, and legitimate binding or mounting (not consisting of glass or any brittle substance) when transmitted in the same packet with the article to which it belongs. In printed circulars it is permissible to make corrections in writing and to insert in writing the date of despatch, the name address, and description of sender, and the name of the addressee.

Book packets must not be closed in any way against examination. **They may be forwarded in open envelopes** ; if sent rolled in a wrapper it must be possible to withdraw the contents for examination, although the packet may be tied at the ends with string.

No book packet may exceed 5lbs. in weight, 18 inches in length, 9 in width, or 6 in depth, unless it be sent to or from a Government Office.

A book packet in the case of which any of these rules is infringed is chargeable, if under 8 oz. in weight, as a letter packet, and if over 8 oz. it is transferred to the Parcel Post and charged a fine of 1d., in addition to any deficient parcel postage.

---

* Entries merely stating who sends the book, &c., or to whom it is given, are not regarded as a letter.

Digitized by Google

PARCEL POST.

Parcels should be marked Parcel Post in left-hand top corner, and with the name and address of sender; but so placed as not to be mistaken for the address of the parcel. The full postage must be prepaid.

	s.	d.
For a parcel not exceeding 1 lb. in weight	0	3
For a parcel exceeding 1 lb. in weight and not exceeding 2 lb.	0	4½

And 1½d. per lb. after up to but not exceeding 11 lbs. weight.
In dimensions a parcel must not exceed 3½ft. in length, or 6ft. in length and girth combined.

PATTERN AND SAMPLE POST.

Trade patterns and samples of merchandise, open to examination, are conveyed in the United Kingdom at 1d. for 4 oz., 1½d. for 6 oz., 2d. for 8 oz. Dimensions must not exceed 12×8×4; and weight must not exceed 8 oz. Articles sent for sale or in execution of an order, or sent by a private individual, are not admissible. It is obligatory that the name, address, and trade of the sender be *printed* on the outside of the wrapper above the address. If this rule be not complied with, the packet will be charged double the deficiency at letter rate of postage.

NEWSPAPERS.

All newspapers registered at the General Post Office, London, printed and published in the United Kingdom at intervals not exceeding 7 days, may be sent singly, or in a packet, within the United Kingdom, for a postage of ½d. for each newspaper. Attention may be called to anything in the newspaper by "See p. —" or some such words (not commenting on the portion marked).

EXPRESS DELIVERY OF LETTERS AND PARCELS.

The object of the new *Post Office Express Service* is to secure the immediate delivery of messages, letters and parcels by special messenger. It is applicable not only to local packets which may be sent from one part of a town or district to another part direct by special messenger, without being forwarded in any mail bag, but also to letters and parcels sent in the first instance by the ordinary mails, either from one part of a town to another, or from one town or country district to another.

I. LOCAL SERVICE—EXPRESS THROUGHOUT.—Under this service messages, letters, and parcels, and other articles are conveyed *the entire distance* by special messenger. *In London* they are accepted at 248 Post Offices, and are delivered in any part of the London Postal Area. *In other parts of the United Kingdom* they are accepted at all Post Offices from which there is a delivery of telegrams, and are delivered in any part of the town or rural district.

The scale of charges is :—

For a letter, packet, or other article not exceeding 1lb. in weight—	
For every mile or part of a mile	3d.
For a letter, packet, or other article over 1lb. in weight—	
For every mile or part of a mile	3d.
For every lb. or part of a lb. beyond the first lb.....	1½d.

II. EXPRESS DELIVERY AFTER TRANSMISSION BY ORDINARY MAIL.—Under this service letters and parcels are forwarded by mail in the regular course of post, and on arrival at the office of delivery are sent out by special messenger.

In addition to the full ordinary postage the Express Fee is :—

For every mile or part of a mile ..... 3d.

If the sender desires that *a special conveyance* be used, or if the distance exceeds two miles, and a public conveyance is not available in both directions, the actual cost of a special conveyance (generally 1s. a mile) must be paid in addition to the above charges, under both services.

The words "Express Delivery" must in all cases be boldly and legibly marked above the address on the left-hand side of the cover (whether of letter or parcel), and in the case of an Express Mail letter the cover must in addition be marked with a *broad perpendicular line from top to bottom both on front and back.*

NOTE.—Every Packet under Service I. must be handed in over the counter. In no case may it be placed in a letter box.

Letters under Service II. may be handed in at a Post Office, or to a Rural Postman, or, if not for registration, may be posted in a letter box.

Parcels and Registered Letters under Service II. must be handed in at a Post Office, or to a Rural Postman.

SPECIAL DELIVERY OF LETTERS, &c., IN ADVANCE OF THE ORDINARY DELIVERIES BY POSTMEN.

Persons who desire at any time to receive their letters or other postal packets of any kind (including book and sample packets, parcels, newspapers, and circulars) in advance of the ordinary delivery, may have them delivered by special messenger on payment of the following fees, viz. :—

The full Express fee of 3d. a mile as for one packet, 1d for every ten, or less number, of additional packets beyond the first, and the usual weight charge of 1½d. a pound beyond the first pound on each packet.

Digitized by Google

Applications for such special delivery must be signed by the person or firm to which the letters or postal packets in question are addressed. Forms of application may be obtained at any Post Office.

The applications should be addressed to the Postmaster or officer in charge of the Office from which the letters are ordinarily delivered, and may be delivered at such Office by hand or sent through the post prepaid. Care should be taken that the application reaches the Office on the previous evening, if it is intended to apply to the early delivery in the morning, and, if to other deliveries during the day, an hour at least before the time at which the delivery by Postmen commences.

The Express fee on at least one packet must be prepaid in stamps affixed to the application. All additional fees must be paid to the special messenger on delivery.

FOREIGN AND COLONIAL PARCEL POST.

The sender of a parcel is required to fill up a Custom House declaration, giving an accurate statement of the contents and value, date of posting, signature, and address; and, in the case of parcels for foreign countries, the net weight of the contents of the parcel.

POSTAL TELEGRAM RATES.

The charge for any message of 12 words throughout the United Kingdom, including the Isle of Man and the Channel Isles, is Sixpence, and a halfpenny for each additional word. Names and addresses of receiver and sender *are charged for.* The cost of a reply may be prepaid, and should be, if immediate attention is required. The message may be written at the office and paid for at the time, or at home on a prepaid form and be enclosed in an envelope, addressed "Telegram, Immediate," and posted in the nearest letter box, in which latter case the message will be telegraphed to its destination from the telegraph office to which the letters included in the next collection are taken.

FOREIGN & COLONIAL TELEGRAM RATES.—(*See* TELEGRAPH TARIFFS, PAGES 207 TO 210.)

RATES OF POSTAGE TO PLACES ABROAD.*

Letters, every ½oz.	2½d.
Post Cards, Single	1d.
Do., Reply	2d.
Newspapers, Books and Printed Papers generally	½d. per 2oz.
Patterns and Samples	½d. per 2oz., with a minimum of 1d.
Commercial Papers	½d. per 2oz., with a minimum of 2½d.

MONEY ORDERS.

The commission on Inland Money Orders is:—For sums not exceeding £1, 2d.; above £1 and not exceeding £2, 3d.; above £2 and not exceeding £4, 4d.; above £4 and not exceeding £7, 5d.; above £7 and not exceeding £10, 6d. No order may contain a fractional part of a penny. Money Orders do not require a receipt stamp.

TELEGRAPH MONEY ORDERS (INLAND).

Money may be transmitted by Telegraph Money Order between all Post Offices in the United Kingdom authorised to transact Telegraph and Money Order business, with the exception that at those offices which forward but do not deliver Telegrams, Telegraph Money Orders can be issued, but cannot be paid. The commission is—For sums not exceeding £1—4d.; above £1 and not exceeding £2—6d.; above £2 and not exceeding £4—8d.; above £4 and not exceeding £7—10d.; above £7 and not exceeding £10—1s. In addition to the commission, a charge is made at the ordinary Inland rate for the Official Telegram authorising payment at the Office of Payment and for the repetition thereof, the minimum being 9d. The telegraph charges only cover the cost of transmitting the Official Telegram of Advice to the Postmaster of the Office of Payment and its repetition. Any telegraphic communication which the Remitter may wish to despatch to the Payee must be paid for at the ordinary Inland rate, the minimum being 6d.

No Telegraph Money Order can be issued for a greater amount than £10.

POSTAL ORDERS.

Postal Orders for certain fixed sums from 1s. to £1 are now issued and paid at all Money Order Offices in the United Kingdom, and at Malta, Gibraltar, Constantinople, India, Hong Kong, Straits Settlements, and Newfoundland. The following are the amounts for which Postal Orders are issued, together with the Poundage payable in respect of each Order:—

Amount.	Poundage.	Amount.	Poundage.	Amount.	Poundage.	Amount.	Poundage.
s. d.	d.	s. d.	d.	s. d.	d.	s. d.	d.
1 0 ...	½	2 6 ...	1	4 6 ...	1	10 6 ...	1
1 6 ...	½	3 0 ...	1	5 0 ...	1	15 0 ...	1½
2 0 ...	1	3 6 ...	1	7 6 ...	1	20 0 ...	1½
		4 0 ...	1	10 0 ...	1		

Broken amounts not being fractions of a penny may be made up by the use of postage stamps not exceeding 5d. in value, affixed to the face of any one Postal Order.

FOREIGN MONEY ORDERS.

The regulations are the same as for inland orders. Money orders are issued on nearly all foreign countries, British Possessions, Agencies, and Colonies, at the following rates of commission, viz.:—For sums not exceeding £2—6d.; £5—1s.; £7—1s. 6d.; £10—2s.

VALUES OF FOREIGN MONEY ORDERS IN ENGLISH CURRENCY.—(*See page* 201.)

* Except the Transvaal, Orange Free State, British Bechuanaland, and interior of Africa, *viâ* the Cape Colony or Natal, for which the rates are:—Letters, every ½oz., 4d.; Post Cards not admitted; Newspapers, Printed Papers, Books, &c., the same rates as for other places abroad.

In calculating amounts payable in the United Kingdom, it must be understood that the Foreign Offices of Exchange reserve to themselves the power of dealing with fractions of a penny as they may deem most convenient. For example, an Order issued in Denmark for 1 Kroner may be credited to this country either as 1s. 1d. or 1s. 2d. An Order issued in Switzerland for 53 Francs may be credited either as £2. 1s. 10d. or £2. 1s. 11d.

* AUSTRIA AND HUNGARY.—The amounts of Money Orders issued in Austria or Hungary in Florins and Kreutzers are converted at the Offices of Vienna or Buda-Pesth, as the case may be, into the French currency of Francs and Centimes, in accordance with the current value of the Piece of 20 Francs in Gold on the day of the despatch of the Advice Lists to London. The sums so advised are converted at the London Office into sterling money at the rates shown in this Column.

† BULGARIA.—The amounts of Money Orders issued in Bulgaria, and payable in the United Kingdom, are advised in the first instance to Switzerland, whence they are re-advised, in Francs and Centimes, by the Swiss Post Office to London.

TELEGRAPHIC COMMUNICATION

BETWEEN

GREAT BRITAIN AND FOREIGN COUNTRIES AND COLONIES.

Specially compiled for this Directory and Handbook.

EUROPE.

THE Continent of Europe is connected with Great Britain by the cables of the following Governments and Companies :—

Eastern.—Triplicate cables to Portugal and Gibraltar—touching at Vigo and Cadiz, in Spain, with a duplicate continuation to the Island of Malta, from whence a line extends to Zante. From Zante a network of cables belonging to the same company connects Trieste (Austria), Otranto (Italy), Greece, Turkey, and almost all the Greek and Turkish islands.

From Portugal, the cable of the Europe and Azores Telegraph Company extends to San Miguel and Fayal in the Azores. Other Islands in the Azores are connected by cables belonging to the Portuguese Government.

Lines from Marseilles to Bona and Malta, and from Modica (Sicily) to Malta, afford alternative routes between Malta and Great Britain.

Direct Spanish.—This company possesses a cable between the Lizard and Bilbao, in Spain, also a short cable from Marseilles to Barcelona.

Government Cables.—Six cables to France, two to Belgium, two to Holland, and three to Germany are owned and worked by the British, French, Belgian, Dutch, and German Governments. These cables form the chief means of telegraphic communication between this country and Western and Central Europe.

Great Northern.—This company by its five cables from England, one to Sweden, two to Norway, and two to Denmark, with continuations to Sweden and Russia, connects Great Britain with Northern Europe. Telegraphic communication between France and the North of Europe is kept up by two cables from Calais to Fanoe (Denmark), belonging to this company.

Indo-European.—This company accepts messages for Southern Russia along its leased lines to Odessa, from which place telegrams are carried forward to Turkey by the cable of the Black Sea Company.

AMERICA AND WEST INDIES.

The North Atlantic is crossed by ten cables, belonging to the Anglo-American (4), Commercial Cable (2), Direct United States (1), French Atlantic (1), and American Telegraph and Cable (2) Companies.

The cables of the latter company are worked by the Western Union Company.

Digitized by Google

Bermuda is connected with International telegraphy by a cable from Halifax, Nova Scotia, belonging to the Halifax and Bermuda Telegraph Company, and the Bahama Islands are connected with Florida by a Government cable from Jupiter Inlet (Florida) to Nassau.

Telegrams for the West Indies are forwarded by the lines of the International Ocean Telegraph (worked by the Western Union) from Florida to Havana, thence by the Cuba Submarine Company along the shores of the island of Cuba, to Santiago, where the lines of the West India and Panama Company commence. The latter company's system embraces almost all the West Indian Islands, and extends to Berbice and Demerara in British Guiana and to Colon (Isthmus of Panama).

La Société Française des Télégraphes Sous-Marins has cables from the island of Cuba to Hayti and on to Port Plata, with a land line across the island to San Domingo, and thence by cable to Curaçoa (Dutch) and on to La Guayra, in Venezuela. From Puerto Plata a second system runs to Martinique, Paramaribo in Dutch Guiana, Cayenne in French Guiana, and Vizeu in Brazil.

For Central America and the West Coast of South America messages are carried by the cables of the Mexican Telegraph Company, from Galveston (Texas) to Tampico and Vera Cruz in Mexico. At this place the lines of the Central and South American Company commence, and carry telegrams on to Goatzacoalcos (Mexico), whence a land line connects Salina Cruz on the Pacific. There is also a direct cable from Galveston to Goatzacoalcos, belonging to the Mexican Telegraph Company. From Salina Cruz the Central and South American Company's cables extend to Lima (Peru), calling at Libertad (Salvador), San Juan del Sur (Nicaragua), San Pedro Gonzalez, Panama, Buenaventura (Colombia), St. Elena (Ecuador), and Payta (Peru), Lima, Iquique, and on to Valparaiso. The same Company has a duplicate cable from Salina Cruz to Chorillos, calling at Juan del Sur and Santa Elena.

From Lima the lines of the West Coast of America Telegraph Company also extend along the coast to Concepcion, calling at Mollendo and Arica in Peru, and Iquique, Antofagasta, Caldera La Serena and Valparaiso in Chili.

The East Coast of South America is connected by the lines of the Eastern Company to Lisbon, and the Brazilian Submarine from thence to Pernambuco.

From Pernambuco the lines of the Western and Brazilian Company extend northward to Para, calling at Ceara and Maranham, and southward there are duplicate cables to Rio Grande do Sul, calling at Bahia, Rio de Janeiro, Santos, and Santa Catarina. The same company also works the duplicate cables of the Platino and Montevidean and Brazilian Telegraph Companies from Rio Grande do Sul to Montevideo, calling at Chuy and Maldonado. The cables of the River Plate Telegraph Company connect Montevideo and Buenos Ayres.

The land lines of the Argentine Government and the Transandine Telegraph Company connect the cables on the East Coast with those on the West Coast of South America, Buenos Ayres to Valparaiso.

AFRICA.

Northern Africa is connected by the cables of the Eastern Company from Gibraltar to Tangier, Malta to Tripoli, Malta to Egypt (2), and Trieste and Otranto (Italy) to Egypt through Zante and Crete. The Spanish Government also work cables to Alboran, Melilla, Ceuta, Alhucemas, Penon de la Gomera, and Tangier.

The Eastern Company has land lines through Egypt from Alexandria and Port Said to Suez, from which place it has four cables to Aden, two of the latter calling at Suakin and three at Perim. From Perim the cables of the Italian Government extend to Assab and Massowah, the Eastern Company also work cables to the French settlement of Obock, and to the Turkish Station of Sheik Seyd in the province of Yemen. The Turkish Government own a cable from Suakim to Djeddah, whence land lines extend to various towns in the province of Hedjaz.

The Eastern and South African Company's cables commence at Aden and are laid along the East Coast of Africa to Durban, calling at Zanzibar, Mozambique, and Delagoa Bay. From Zanzibar branch cables extend to the Seychelles and Mauritius, also to Mombasa, Bagamayo, and Dar-es-Salaam; the cables to the two latter places are the property of the German Government. This company also owns cables from Cape Town to Mossamedes, Benguela, and Loanda, where a junction is effected with the lines of the West African Company, thus affording a duplicate route, *via* the West Coast, with the South African States.

From Durban the Government land lines extend to other parts of Natal, Transvaal and the Orange Free State. From Cape Town the Government lines reach all parts of Cape Colony and into the territory of the British South Africa Company as far as Fort Salisbury.

The ports along the West Coast of Africa are connected by the cables of the African Direct, Spanish National, and West African Companies. St. Vincent, the starting place of the African Direct Company, is connected with Europe by means of the Eastern Company's cables to Lisbon, and the line of the Brazilian Submarine from Lisbon *via* Madeira. From St. Vincent the cables extend to Bonny, calling at St. Iago, Cape de Verd Islands, Bathurst, Sierra Leone, Accra, Lagos and Brass.

The Spanish Government own and work the cable between Cadiz and the Canary Islands.

The Spanish National Company own the cable between the Canary Islands and Saint Louis in Senegal. Saint Louis and Dakar are connected by a cable belonging to the India Rubber Company. From St. Louis the South American Company's cables extends to Pernambuco, calling at Fernando de Noronda.

The West African Company's line is divided into two sections. The first start, from Dakar and extends to Sierra Leone, with stations at Bathurst, Bissao, Bolama, and Conakry. The second section commences at Grand Bassam, and has landing places at Accra, Kotonou, and St. Thomé; another line starts from Bonny to Principe and St. Thomé, thus forming duplicate communication by aid of the African Direct cables between the latter place and Accra. Numerous Stations in the Gold Coast are connected by Government land lines from Accra extending to Lomé and Little Popo in German Territory. From St. Thomé cables are laid to Gaboon and Loanda. From Bonny the German Government cable connects the Cameroons, and from Kotonou the French Government have a line to Whydah.

Cadiz, the starting place of the Canary Islands cable, is connected with Great Britain by the cables of the Eastern Company *via* Vigo, *via* Lisbon, or *via* Gibraltar, and by the cable of the Direct Spanish Company *via* Bilbao.

ASIA AND OCEANIA.

There are two main routes between Great Britain and India, viz.: those of the Eastern and Indo-European Companies.

The Eastern Company's route goes through Malta, which is reached by triplicate and duplicate cables through Lisbon and Gibraltar, and by a special leased line through France to Marseilles, thence by duplicate cables touching at Bona; from Malta by triplicate cables to Alexandria, land lines through Egypt, quadruple cables down the Red Sea to Aden, and triplicate cables to Bombay.

The Indo-European Company's duplicate lines cross the North Sea, traverse Germany and Russia, to Teheran in Persia. From this place the land lines are maintained by the Indian Government as far as Bushire, whence the Government cables are laid along the Persian Gulf to Jask, Gwadur and Kurrachee. There is a cable also from Bushire to Fao in Turkey.

The land lines of the Indian Government connect Bombay and Kurrachee with Madras, the starting point of the Eastern Extension, Australasia and China Company's cables.

The duplicate cables from Madras to Penang, Malacca, Singapore, Sumatra, Java, and Port Darwin in Australia belong to the Eastern Extension Company. From Port Darwin the land lines of the South Australian Government cross the continent to Adelaide, whence land lines extend to all parts of Australia. A third cable has been laid between Java and Australia, landing at Roebuck Bay in Western Australia, which place is connected by land lines with the rest of Australia. From Penang the native State of Perak is connected, and from Malacca land lines extend to the States of Selangor, Sunjie Ujung, and Jelebu. From Penang there is also a cable connecting Deli and Acheen (in the Dutch Indies). The cable between Penang and Singapore has recently been triplicated.

The duplicate cables between New South Wales and New Zealand and Victoria and Tasmania belong to the Eastern Extension Company.

From Queensland the cable of the Société Francaise des Télégraphes Sans Marins connects New Caledonia.

The Eastern Extension Company also possess cables from Singapore to Cochin China, Tonquin, Hong Kong, Manila (Philippine Islands), Macao, Foochow, and Shanghai. From Cochin China land lines extend to the Kingdom of Siam.

Another route to China is by the Great Northern Company's lines to Libau in Russia, thence by land lines across Russia *viâ* Siberia to Wladiwostock on the Pacific. The Chinese and Russian Governments telegraph systems are connected at the Helampo-Blagowestchensk frontier.

From Wladiwostock the Great Northern Company has duplicate cables to Nagasaki (Japan) and Shanghai; also single cables from Shanghai to Amoy and Hong Kong, and from Nagasaki to the Island of Tsushima and Fusan in Corea.

The land lines of the Chinese Government connect the interior of China and Corea with the cables of the Eastern Extension and Great Northern Companies at Shanghai, Amoy, Foochow, and Hong Kong. The Chinese Government also possess cables connecting the Islands of Hainan and Formosa.

INSTITUTION OF ELECTRICAL ENGINEERS.—(*Continued*).

ABSTRACT OF THE MEMORANDUM AND ARTICLES OF ASSOCIATION.

The chief objects for which the Institution is established are :—

To promote the general advancement of Electrical and Telegraphic Science and its applications, and to facilitate the exchange of information and ideas on these subjects amongst the Members of the Institution and otherwise, and for this purpose—To hold meetings of the Institution for reading and discussing communications bearing upon Electrical and Telegraphic Science, or the applications thereof, or upon subjects relating thereto. To hold or promote Exhibitions of instruments, apparatus, or other appliances connected with Electrical or Telegraphic Science, or its applications. To print, publish, sell, lend, or distribute the proceedings or reports of the Institution, or any papers, communications, works, or treatises on Electrical or Telegraphic Science, or its applications, or subjects connected therewith, in the English or any foreign tongue, or any abstracts thereof, or extracts therefrom. To take charge of the books, pamphlets, publications, and manuscripts known as the Ronalds Library, which are the subject of a Deed of Trust dated 24th June, 1875, and to observe and perform the Trusts of the said Deed, and to add to the said Ronalds Library, or form any supplemental or additional library of books, works, or manuscripts on Electrical or Telegraphic Science, or the applications thereof, or other subjects allied thereto. To make grants of money, books, apparatus, or otherwise for the purpose of promoting invention and research in Electrical or Telegraphic Science, or its applications, or in subjects connected therewith. To purchase, take on lease, or otherwise acquire, and also let, lease or to dispose of, any premises or other property for the purposes of the Institution, subject to the provisions of Section 21 of the Companies Act, 1862. To do all other such lawful things as are incidental or conducive to the attainment of the above objects.

The Institution shall consist of Members, Associates, Foreign Members, Students, and Honorary Members. Every Member shall come within one of the following descriptions :—(*a*) He shall have been regularly educated as a Telegraph Engineer or Electrical Engineer or Electrician (according to the usual routine of pupilage), and have had subsequent employment for at least five years in responsible situations; (*b*) or he shall have practised on his own account in the profession of a Telegraph Engineer, Electrical Engineer, or Electrician, for at least two years, and have acquired a degree of eminence in the same; (*c*) or he shall be so intimately associated with Electrical or Telegraphic Science that the Council consider his admission to Membership would conduce to the interests of the Institution.

ASSOCIATES shall, except in the case of those transferred from the class of Students, be persons of more than 21 years of age; and all Associates, whether so transferred or not, shall be persons who are connected with Electrical or Telegraphic Science or Engineering, either professionally or otherwise, or who are so intimately associated with Electrical or Telegraphic Science that the Council consider their admission as Associates would conduce to the interests of the Institution.

FOREIGN MEMBERS shall be *foreigners* residing abroad, engaged in, or intimately connected with, Electrical or Telegraphic Science or Engineering, whose admission to the privileges of Membership the Council consider would conduce to the interests of the Institution.

Digitized by Google

STUDENTS shall be persons who are serving pupilage to an Electrical Engineer, or who are studying Electrical Science at one of the Universities, Public Colleges, Technical Institutions, or Government Schools, approved by the Council, and who are duly recommended by a Member. After two years from the date of the election of a Student, he shall, if he comes within the description given in Article 10, be eligible for transfer from the class of Students to the class of Associates. If not so eligible for transfer at the end of three years from the date of his election, he shall, if he have then attained the age of 21 years, and otherwise on attaining that age, cease to be a Student of the Institution or to be otherwise connected therewith. Any person who shall cease to be a Student of the Institution by the operation of the above Regulation, shall be eligible at any subsequent time to be elected as an Associate or Member, if nominated and balloted for in the ordinary way.

HONORARY MEMBERS shall be distinguished persons who, from their position or attainments, are intimately connected with Electrical or Telegraphic Science or Engineering, or the practical application thereof, but who are not professionally engaged therein.

Every candidate for election into the Institution, otherwise than as an Honorary Member, shall be duly proposed and seconded, in writing, by a Member; the Secretary shall thereupon submit his application to the Council, to be considered, and, if it is approved by them, it shall be brought before the next General Meeting of the Institution for approval.

HONORARY MEMBERS shall be elected by the Council, and notice of such Election shall be given at the next General Meeting of the Institution, but not more than one Honorary Member shall be elected in any one year.

BALLOTS shall take place at the Ordinary General Meetings of the Institution, but no candidate for admission shall be balloted for at the same meeting at which his application is announced. Members and Associates only have the right of voting for admission of candidates. The proportion of votes necessary for the election of any candidate shall be at least two-thirds of the total number of votes given. In the case of the non-election of a candidate, a second ballot shall be granted, if demanded, by a written notice addressed and sent to the Secretary within a fortnight by any three persons having a right to vote, and such ballot shall take place at the next General Meeting at which candidates are balloted for.

The Council shall decide upon the applications for transferring any Member of the Institution from one class to another.

Every Member elected before the 31st of December, 1891, shall pay to the Institution an entrance fee of Two Guineas on his election; or, if elected after the said date, an entrance fee of Three Pounds. Every Foreign Member shall pay an entrance fee of One Guinea. Every Associate, if elected before the 31st December, 1891, shall pay an entrance fee of One Guinea; or, if elected after the said date, One Pound Ten Shillings. Every Associate transferred to the Class of Members before the 31st of December, 1891, shall pay a further entrance fee of One Guinea; or if transferred after the said date, a further entrance fee of One Pound Ten Shillings. Every Student transferred to the Class of Associates shall pay an entrance fee of One Guinea.

Except as hereinafter provided, every Member elected before the 31st of December, 1891, shall contribute annually to the Institution the sum of Two Guineas; or, if elected after the said date, the sum of Three Pounds. Every Associate elected before the 31st December, 1891, shall contribute annually the sum of One Guinea; or, if elected after the said date, the sum of One Pound Ten Shillings. Every Foreign Member shall contribute annually the sum of One Pound, and every Student Half-a-Guinea. Any Member or Associate residing abroad, or absent from the United Kingdom for nine months in any year, and

Digitized by Google

giving previous notice in writing to the Secretary of his intended absence, shall contribute annually the sum of One Pound.

Honorary Members shall not be required to pay any contributions.

Any Member elected before the 31st December, 1891, may compound for his annual subscription by the payment to the Institution in one sum of Twenty-one Pounds if resident in the United Kingdom, or, if resident abroad, by the payment in one sum of Ten Pounds. Any Member elected after the said date may compound by the payment in one sum of Twenty-five Pounds if resident in the United Kingdom, or, if resident abroad, by the payment in one sum of Ten Pounds. Any Associate elected before the 31st December, 1891, may compound for his annual subscription by the payment in one sum of Ten Pounds; or, if elected after the said date, by the payment in one sum of Twelve Pounds Ten Shillings if resident in the United Kingdom, or of Ten Pounds if resident abroad. Any Foreign Member may similarly compound by the payment in one sum of Ten Pounds. Any Foreign Member, or any Member who, as residing abroad, has compounded by payment of Ten Pounds, shall, if he come to reside in the United Kingdom, and if he was elected before the 31st December, 1891, pay either an additional composition of Eleven Pounds or an annual subscription of One Guinea. If he was elected after the said date, he shall pay either an additional composition of Fifteen Pounds or an annual subscription of Two Pounds. Any Associate elected after December 31st, 1891, who, as residing abroad, has compounded by the payment of Ten Pounds, shall, if he comes to reside in the United Kingdom, pay either an additional composition of Two Pounds Ten Shillings or an annual subscription of Ten Shillings. All such compositions shall be invested, and the interest alone shall be appropriated to the current expenditure of the Institution at the direction of the Council. Any donations in aid of the funds of the Institution may be accepted by the Council and Treasurer.

A Foreign Member who has not compounded shall, if he come to reside in the United Kingdom, pay an annual subscription of Two Guineas if he was elected before the 31st December, 1891, or of Three Pounds if he was elected after the said date.

An Associate resident in the United Kingdom who has compounded by payment of Ten Pounds shall, if transferred to the Class of Members before the 31st December, 1891, pay either an additional composition of Eleven Pounds or an annual subscription of One Guinea. If transferred after the said date, he shall pay either an additional composition of Fifteen Pounds or an annual subscription of Two Pounds. An Associate resident in the United Kingdom who has not compounded shall, if transferred to the Class of Members before the 31st December, 1891, pay an annual subscription of Two Guineas; or, if transferred after the said date, an annual subscription of Three Pounds.

The Annual contributions shall be payable in advance on the 1st of January in each year.

In case the expulsion of any individual shall be judged expedient by ten or more Members or Associates, and they think fit to draw up and sign a proposal requiring such expulsion, the same, being delivered to the Secretary, shall be by him laid before the Council for consideration.

THE COUNCIL shall consist of the President, past Presidents, four Vice-Presidents, Twelve Members, three Associates, and the Honorary Treasurer, and all these (except the three Associates) shall be chosen from the class of Members.

The President, Vice-Presidents, Auditors, and Treasurer shall be elected annually by ballot, and, with the exception of the President, shall be immediately eligible for re-election; but the President shall be ineligible for re-election to that office during the following year. Three Members of the Council and the three

Digitized by Google

Associate Members shall retire annually, and be ineligible for re-election during the following year. Casual vacancies in the Council during the year may be filled up by the Council, and announced at the next Meeting of the Institution. The Council shall, previous to the Annual General Meeting in each year, prepare a list of Members whom they propose as suitable for the offices of President, Vice-Presidents, and Treasurer for the ensuing year. The list shall also contain the names of a sufficient number of Members and Associates to fill the vacancies in the Council, and whom the Council nominate as fitted to become Members of the Council.

The COUNCIL shall meet as often as the business of the Institution may require; and at every meeting five shall constitute a quorum. The Council may appoint sub-committees, chosen from their own body, for special purposes, and with such powers as the Council may prescribe.

The Sessions of the Society shall commence on or about the 1st November of each year, and terminate on or about the 1st June of the following year. During these months the Meetings of the Institution will be held at such place and on such evenings as the Council may appoint, and notice of which will be given to Members and Associates by the Secretary before the commencement of each Session.

The Annual General Meeting of the Institution shall be held at the Meeting next previous to Christmas Eve, to receive and deliberate upon the Report of the Council on the state of the Institution, and to elect the Officers for the ensuing year. No new question shall be introduced, or motion be made, at an Ordinary General Meeting later than one hour and a half after the time fixed for the commencement of such Meeting.

Every Member and Associate shall have the privilege of introducing one visitor, to be present at the Ordinary General Meetings of the Institution, on writing his name in a book provided for that purpose, or sending with him a card signed with his name, according to a form provided. No question shall be discussed, or motion be made, at the Ordinary General Meetings relative to the direction and management of the concerns of the Institution.

A Special General Meeting of Members and Associates may be called at any time by the Council for a specific purpose relative to the direction and management of the concerns of the Institution, and the Council are at all times bound to do so on a requisition, in writing, of ten Members and Associates, specifying the nature of the business to be transacted.

THE ELECTRICAL AND ALLIED TRADES SECTION OF THE LONDON CHAMBER OF COMMERCE.

CHAIRMAN.—Major S. Flood Page (Edison and Swan United Electric Light Co., Limited).

VICE-CHAIRMEN.—Mr. Emil Garcke (Brush Electrical Engineering Company, Limited). Mr. Alexander Siemens (Messrs. Siemens Bros. and Co., Limited).

OBJECTS OF THE ELECTRICAL AND ALLIED TRADES SECTION.

The special advantages of organising under the auspices of the Chamber of Commerce are, that the Chamber is in possession of suitable premises and staff, under which the necessary work of the Section can be adequately performed; time is spared to members in preparing Bye-Laws and other regulations of procedure; whilst no financial responsibility is involved beyond payment of the entrance fee and subscription to obtain membership of the Chamber; nor is it necessary even for members, in case they are not satisfied with the management of the Committee, to continue their membership or subscription, as enrolment in the Chamber does not involve more than an annual subscription, which can always be terminated by a month's notice prior to the expiration of the current year. The formation of the Section in connection with the Chamber is in every way, therefore, less costly and at the same time more effective than if it were attempted to form a separate Committee apart from the Chamber.

The Electrical and Allied Trades Section does not interfere with the work of existing Associations, but only deals with matters that are purely commercial. The Section, in fact, is an integral part of the London Chamber of Commerce—a body composed of over 3,500 Members engaged in almost every kind of trade and industry. No less than 35 Trade Sections, formed within the Chamber itself, are directly represented on the Council by their own delegates, in addition to 17 of the leading Mercantile Associations in London, and it is intended to give the same right to the remaining branches of commerce. It was felt that so important an interest as that of the electrical and allied branches should not remain without direct representation, and this has been secured by the formation of the Electrical and Allied Trades Section, whose chairman possesses a seat on the Council of the Chamber, to whom he submits for confirmation all resolutions, reports, or recommendations adopted by the Section. Action is then taken in the name of the Chamber itself.

Amongst the matters with which the Section has dealt may be mentioned—The Standardising and Certification of Meters and other Electrical Measuring Instruments by the Government, and the establishment of a Laboratory for this purpose; the Board of Trade Overhead Wire Regulations; the British Association Standard Screw-Thread; Railway Rates; United Action of Electric Supply Companies in the matters of the Legal Expenses of Local Authorities, and of selling their Undertakings at a Shorter Period than 42 years; County Council Bye-Laws for Regulation of London Overhead Wires; Electrical Traction; Crystal Palace and Frankfort Electrical Exhibitions; Foreign Tariffs, Customs Classification, Arbitrations (under the Bye-Laws of the London Chamber of Arbitration). On some of these subjects the recommendations which the Section has made have already been of special value, and have been recognised by Government and other Departments.

Secretary of the London Chamber of Commerce . KENRIC B. MURRAY.

LEONARD STREET, LONDON, E.C.

Principal.—Prof. Silvanus P. Thompson, D.Sc., F.R.S.
Mechanical Engineering.—Prof. John Perry, M.E., D.Sc., F.R.S.
Senior Demonstrator.—R. G. Blaine, M.E.
Instructor in Engineering Drawing.—R. Johnston, Wh.Sc.
Physics and Electrical Engineering.—Prof. Silvanus P. Thompson, D.Sc., F.R.S.
Senior Demonstrator.—E. A. O'Keeffe, B.E.
Instructor in Electro-Deposition.—E. Rousseau.
Applied Chemistry.—Prof. Meldola, F.R.S., F.I.C.
Senior Demonstrator.—John Castell-Evans, F.I.C.
Registrar.—K. Dove.

DURHAM COLLEGE OF SCIENCE, NEWCASTLE-ON-TYNE.

Principal.—Prof. W. Garnett, M.A., D.C.L.
Pure and Applied Mathematics.—Prof. R. A. Sampson, M.A., F.R.A.S.; Lecturer, C. M. Jessop, M.A.
Physics.—Prof. Henry Stroud, M.A., D.Sc.; Lecturers, R. J. Patterson and (Demonstrator) V. A. Mundella, B.A., B.Sc.
Chemistry.—Prof. P. Phillips Bedson, D.Sc., B.Sc., F.C.S.; Lecturers, S. Shaw, F.C.S., and (Demonstrator) F. C. Garrett, M.Sc.
Engineering.—Prof. R. L. Weighton, M.A.; Lecturer, R. M. Ferrier, B.Sc.
Secretary.—H. F. Stockdale.

ROYAL COLLEGE OF SCIENCE.

SOUTH KENSINGTON AND JERMYN STREET, LONDON.

Dean.—Rt. Hon. Prof. T. H. Huxley, LL.D., F.R.S.
Chemistry.—Prof. T. E. Thorpe, B.Sc.(Vic.), Ph.D., F.R.S.; Assistant Professor, W. P. Wynne, D.Sc.; Demonstrators, H. Chapman Jones and A. E. Tutton; Assistants, G. S. Newth, J. W. Rodger, and W. Tate; Teaching Scholars, W. Kirman, and H. Grime.
Mechanics and Mathematics.—Prof. T. M. Goodeve, M.A.; Assistant Professor, A. R. Willis, M.A., D.Sc.; Instructors, P. T. Wrigley, M.A., and J. Harrison, M.Inst.M.E., Assoc. M.Inst.C.E.; Demonstrator, J. E. Livsey, M.Inst.M.E.; Assistant, G. A. Baxandall.
Physics.—Prof. A. W. Rücker, M.A., F.R.S.; Assistant Professor, C. V. Boys, F.R.S.; Occasional Lecturer, Captain W. de W. Abney, C.B., D.C.L., F.R.S. (late R.E.); Demonstrator, H. H. Hoffert, D.Sc.; Assistants, W. Watson, B.Sc., W. Williams, and E. Edser.
Metallurgy.—Prof. W. Chandler Roberts-Austen, C.B., F.R.S.; Instructor in Assaying, E. J. Ball, Ph.D.; Assistants, E. A. Smith and H. C. Jenkins, Assoc. M.Inst.C.E.
Registrar.—(Vacant).
Clerk and Librarian.—A. E. Cooper.

ROYAL COLLEGE OF SCIENCE, DUBLIN.

Physics.—Prof. W. F. Barrett, F.R.S.E., M.R.I.A. (Dean of Faculty, Session 1893-94); Assistant, W. Brown.
Applied Mathematics and Mechanism.—Prof. W. McFadden Orr, M.A.; Demonstrator, J. P. Johnston.
Engineering, &c.—Prof. James Lyon, M.A.; Assistant, J. Taylor.
Chemistry and Metallurgy.—Prof. W. N. Hartley, F.R.S., F.C.S., F.R.S.E.
Secretary.—Prof. J. P. O'Reilly, C.E., M.R.I.A.

MASON COLLEGE, BIRMINGHAM.

Principal.—Robert S. Heath, M.A., D.Sc.
Secretary and Registrar.—G. H. Morley.

ELECTRICAL DEPARTMENT.

Mathematics.—Prof. Robert S. Heath, M.A., D.Sc.; Lecturer, L. Crawford, B.A.
Physics.—Prof. J. H. Poynting, D.Sc., F.R.S.; Assist. Lecturer, Philip L. Gray, B.Sc.
Chemistry.—Prof. W. A. Tilden, D.Sc., F.R.S., F.I.C.; Assistant Lecturer, W. W. J. Nicol, M.A., D.Sc., F.I.C.; Demonstrators, Thomas Turner, Assoc. R.S.M., F.I.C., and S. Williamson, Ph.D.
Civil, Mechanical and Electrical Engineering.—Prof. Robert H. Smith, M.I.M.E., Assoc.M.Inst.C.E.; Demonstrator and Workshop Instructor, Harry M. Waynforth.

FIRTH COLLEGE, SHEFFIELD.

Principal.—Prof. W. M. Hicks, Sc.D., F.R.S.
Mathematics.—Prof. A. H. Leahy, M.A.
Physics.—Prof. W. M. Hicks, Sc.D., F.R.S.; Demonstrator, R. Lehfeldt, B.A.
Chemistry.—Prof. W. Carleton Williams, B.Sc., F.C.S.; Demonstrator, Dr. George Young.
Registrar and Secretary.—Ensor Drury.

Digitized by Google

SHEFFIELD TECHNICAL SCHOOL.

Principal.—Prof. W. Ripper, M.I.M.E.
Engineering.—Prof. W. Ripper; Demonstrators, F. Boulden, Jos. Husband, A.R.C.S., and J. W. Kershaw, B.Sc.
Metallurgy.—Prof. J. O. Arnold, F.C.S.; Demonstrator, Jos. Jefferson, A.R.S.M.
Physics and Electrical Engineering.—Ellis H. Crapper.
Mathematics.—F. Boulden, Jos. Husband, R. S. Thompson, and J. Stebbings.
Electro-Metallurgy.—Byron Carr.
Secretary.—Walter Swift.

HERIOT-WATT COLLEGE, EDINBURGH.

Principal and Professor of Mechanics.—F. Grant Ogilvie, M.A.. B.Sc., F.R.S.E.
Chemistry.—Prof. John Gibson, Ph.D., F.R.S.
Mechanical Engineering.—Prof. Richard Stanfield, F.R.S.E., A.M.I.C.E.
Applied Physics and Electrical Engineering.—Prof. R. Mullineux Walmsley, D.Sc., F.R.S.E., M.I.E.E.
Mathematics.—James M'Kean, F.E.I.S.; James A. Wilson, M.A., B.Sc.
Instructors in Handicrafts.—A. R. Mackay, W. Webster.

THE GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE, GLASGOW.

Natural Philosophy.—Prof. James Blyth, M.A., F.R.S.E.; Assistant, Angus McLean, B.Sc., C.E.
Chemistry.—Prof. Geo. G. Henderson, D.Sc., M.A.; Assistants, Thomas Gray, B.Sc., James Robson, F.I.C., F.C.S., and Augustus Schlœsser, M.Sc., Ph.D.
Electrical Engineering.—Prof. Andrew Jamieson, M.I.C.E., F.R.S.E.; Assistant, J. Livingstone.
Machine Design.—Alexander MacLay, B.Sc., C.E.; Assistants, James Hamilton and David Finlayson.
Technical Chemistry.—E. J. Mills, D.Sc., F.R.S.; Assistant, James Morison.
Mathematics.—Prof. William Raitt, M.A., B.Sc.; Assistant, John Dougall, M.A.
Applied Mechanics.—Prof. William T. Rowden, B.Sc.; Assistant, John Duncan.
Metallurgy.—A. Humboldt Sexton, F.C.S., F.I.C.; Assist., Henry C. Thorpe, B.A.
Steam and Steam Engines.—Wm. H. Watkinson, Wh.Sc., M.I.M.E.; Assistant, Robert M. Anderson.
Civil Engineering.—Gilbert Thomson, M.A., C.E.
Mining and Geology.—Louis H. Cook, A.R.S.M.
Chairman of Governors.—Thomas Russell.
Secretary and Treasurer.—John Young, M.A., B.Sc.

QUEEN'S COLLEGE, BIRMINGHAM.

Warden.—Rev. W. H. Poulton, M.A.
Chemistry.—W. A. Tilden, D.Sc.
Physics.—J. H. Poynting, D.Sc.

ST. DAVID'S COLLEGE, LAMPETER.

Principal.—Very Rev. J. Owen, M.A.
Head Master of the College School.—Rev. Thomas M. Evans, M.A.
Physical Science and Mathematics.—Prof. A. W. Scott, M.A.
Pure Mathematics.—Lecturer, P. J. Kirkby, B.A.

Digitized by Google

BRADFORD TECHNICAL COLLEGE.

Head Master of Day School.—James Spencer, B.Sc.(Lond.), F.C.S.
Higher Mathematics, Physics and Electrical Engineering (Day School).—J. T. Riley, D.Sc.(Lond.)
Chemistry (Day School).—S. F. Stell.
Chemistry Department.—Head Master, A. Dufton, B.A.; Assistant, Frederick Tetley.
Mechanical and Engineering Department.—Head Master, G. F. Charnock, Assoc. M.Inst.C.E.; Assistant Master, J. E. Rycroft.
Secretary.—John Nutter.

HUDDERSFIELD TECHNICAL COLLEGE.

Chemistry.—George Jarmain, F.I.C.
Engineering.—Thomas Kershaw, M.S.A.
Physics.—Alfred Sheard.
Mathematics.—W. H. Hirst, B.A.
Organising and Managing Secretary.—Austin Keen, F.C.S.

MANCHESTER MUNICIPAL TECHNICAL SCHOOL.

Director and Secretary.—J. H. Reynolds.
Mathematics.—J. P. Wrapson, B.A.; J. Crowther.
Electrical Engineering.—W. W. Haldane Gee, B.Sc., F.C.S.; S. Joyce, A.I.E.E.; and B. B. Skirrow, M.A.(Oxon.)
Telegraphy and Telephony.—J. F. Taylor.
Mechanical Engineering.—H. G. Jordan, A.R.C.S. (Dublin), F. C. Forth, W. H. Davies, W. H. Cummins, and W. A. Rogerson.
Chemistry.—E. Knecht, Ph.D.; J. Grant, F.C.S.; and E. L. Rhead.

ELECTRICAL STANDARDIZING, TESTING AND TRAINING INSTITUTION,

FARADAY HOUSE, CHARING CROSS ROAD, LONDON, W.C.

Principal.—Hugh Erat Harrison, B.Sc., A.M.I.C.E., M.I.E.E., F.C.S.
Engineer.—H. H. P. Powles, A.M.I.C.E., M.I.M.E.
Mathematical Lecturer.—Alexander Russell, M.A.
Chemical Lecturer.—Charles J. Wilson, F.I.C., F.C.S.
Demonstrator.—A. Campbell, M.A., Haydn T. Harrison, A.I.E.E.
Secretary.—Philip Arderne Latham, M.A.

RUTHERFORD COLLEGE, NEWCASTLE-ON-TYNE.

Principal.—A. M. Ellis.
Mathematics and Physics.—R. H. Jude, D.Sc.
Applied Mathematics.—C. Innes, M.A.
Chemistry and Metallurgy.—G. Smith, B.Sc.
Mechanical Engineering.—C. Innes, M.A.
Secretary.—H. Crawford Smith.

BRISTOL MERCHANT VENTURERS' TECHNICAL SCHOOL.

Head Master.—J. Wertheimer, B.Sc., B.A., F.C.S., F.I.C.
Electrical Engineering and Physics.—W. Wilson, M.A., and T. Dobson, B.A.
Mathematics.—F. W. Shurlock, B.A., B.Sc., and G. Smith, B.A.
Engineering.—John Munro, M.I.Mech.E.
Chemistry.—C. E. Boucher, B.Sc.
Telegraphy.—A. Oakshott.
Metal Working.—C. E. Hill.
Plumbing.—W. H. Perry and T. J. Edmunds.

ROYAL NAVAL COLLEGE, GREENWICH.

President of College.—Admiral Sir R. Vesey Hamilton, K.C.B.
Director of Studies.—W. D. Niven, M.A., F.R.S.
Mathematics.—Profs. C. J. Lambert, M.A., and W. Burnside, M.A.; Instructors, W. Gleed, M.A., N. Fletcher, B.A., and Rev. J. L. Robinson, M.A., R.N.
Applied Mechanics.—Prof. J. H. Cotterill, M.A., F.R.S.; Instructor, Robert B. Dixon.
Physics.—Prof. A. W. Reinold, M.A., F.R.S.; Assistant Prof. J. W. W. Waghorn, D.Sc.; Instructor, T. H. Blakesley, M.A., C.E.
Chemistry.—Prof. Vivian B. Lewes.

ROYAL MILITARY ACADEMY, WOOLWICH.

Assist.-Commandant and Secretary.—Col. J. M. Murray, R.A.
Mathematics and Mechanics.—H. Hart, M.A.
Chemistry and Physics.—Dr. W. R. E. Hodgkinson.

ROYAL ENGINEERING COLLEGE, COOPER'S HILL, STAINES.

(Nominations to the Indian Telegraph Department are made from the Engineer Student at this College at the end of their first year of study.)

President.—General Sir Alexander Taylor, G.C.B., R.E.
Applied Mathematics.—G. M. Minchin, M.A.
Pure Mathematics.—A. Lodge, M.A.
Engineering.—Callcott Reilly, M.Inst.C.E.
Demonstrator in Mechanical Laboratory.—P. Reilly.
Chemistry.—Herbert McLeod, F.R.S.; Demonstrator, F. E. Matthews, Ph.D.
Physics.—W. N. Stocker, M.A.; Demonstrator, F. Shields, M.A.
Secretary.—Lieut.-Col. W. J. Boyes.

ELECTRICAL AND GENERAL ENGINEERING COLLEGE,

PENYWERN HOUSE, 2 AND 4, PENYWERN ROAD, EARL'S COURT, LONDON, S.W.

Principal.—G. W. de Tunzelmann, B.Sc., M.I.E.E.
Senior Instructor.—C. Capito, M.I.E.E., M.I.M.E.
Mathematics and Physics.—G. W. de Tunzelmann; Mathematical Demonstrator, R. R. Corkling.
Electrical Engineering.—G. W. de Tunzelmann and C. Capito.
Civil and Mechanical Engineering.—C. Capito.
Engineering Drawing.—C. Capito and W. D. Porterfield.
Chemistry.—T. G. Nicholson, B.Sc.
Geology and Mineralogy.—J. H. Vanstone and E. Wetherell.

(*See* ADVERTISEMENT *facing* Colleges, Schools, &c., *in* CLASSIFIED SECTION.)

CRYSTAL PALACE COMPANY'S SCHOOL OF PRACTICAL ENGINEERING.

Principal.—J. W. Wilson.
Superintendent of Department.—R. G. Hodson.

HARTLEY INSTITUTION, SOUTHAMPTON.

Executive Officer.—T. W. Shore, F.C.S., F.G.S.
Engineering.—J. Eustice.
Electricity, Physics and Chemistry.—J. Brierley and W. S. Crocker, A.R.C.S.
Mathematics.—I. Jeffares, M.A.

USEFUL INFORMATION RELATING TO ELECTRICAL LIMITED LIABILITY CONCERNS.

We give below particulars relating to Limited Liability concerns, which we trust will be found of service to those of our subscribers having business relations with these Companies. We have endeavoured to make the information complete, and where this is not the case it is because no fuller information is obtainable. We shall be pleased to receive, during 1894, assistance from those who are able to help us in keeping this list complete.

Name of Company, Address of Office, and Date of Registration.	Directors and Chief Officials.	Nominal or Authorised Capital.	Total Amount called up.	Dividends Payable.	Last Dividend Paid.	Closing Quotation. 1892	Closing Quotation. 1893.
ABELL'S ELECTRICAL ENGINEERING COMPANY, LIMITED.—*In liquidation.*

PRINCIPAL ELECTRIC LIGHTING PATENTS EXPIRING IN 1894, 1895 AND 1896.

Among the patents which expire, if not already dropped, during 1894, 1895 and 1896 are the following :—

EXPIRE **1894.**

Dated 1880.	No.	Name.	Subject of Patent.
Jan. 2	18	J. W. SWAN	"Running on the pump."
Jan. 20	250	J. W. SWAN	Parchmentised paper filament.
Jan. 23	315	W. R. LAKE	Thomson-Houston dynamo.
Feb. 10	578	T. A. EDISON	Lampholders
Apr. 5	1,392	W. R. LAKE	Maxim dynamo.
Apr. 6	1,397	C. D. ABEL	Pilsen lamp.
Sept. 16	3,765	E. C. BREWER	Edison's bamboo filament.
Sept. 24	3,880	P. JENSEN	Edison's feeder system.
Nov. 27	4,933	J. W. SWAN	Parchmentised cotton filament.

EXPIRE **1895.**

Dated 1881.	No.	Name.	Subject of Patent.
Jan. 11	129	C. FAURE	Secondary lead battery, pasted plate.
Feb. 23	768	T. A. EDISON	Lamp filament joint, by plating.
Feb. 28	783	J. PERRY & W. E. AYRTON	Electric traction, buried conductor and block system.
Apr. 26	1,802	T. A. EDISON	Screw lamp holder and lead fuse.
Apr. 28	1,835	C. F. BRUSH	The Brush regulator.
May 10	2,038	R. J. GÜLCHER	The Gülcher arc lamp.
July 7	2,989	J. HOPKINSON	Coupling two or more motors, in series or parallel, for varying the speed of vehicles.
July 21	3,189	H. S. MAXIM	The Maxim glow lamp.
Aug. 18	3,599	C. LEVER	The Lever arc lamp.
Sept. 10	3,926	J. S. SELLON	Secondary battery plates, roughened and indented.
Sept. 29	4,202	J. W. SWAN	Lamp filament jointing by flashing.
Oct. 11	4,409	W. O. CALLENDER	Vulcanized bitumen for cables.
Dec. 28	5,702	J. W. SWAN	Lamp holder for bottom-loop lamps.

EXPIRE UP TO JUNE, **1896.**

Dated 1882.	No.	Name.	Subject of Patent.
Jan. 4	49	J. HOPKINSON	Motor meter.
Feb. 15	730	C. A. FAURE	Mercury motor meter.
Mar. 7	1,094	E. H. JOHNSON	Edison socket lampholder.
Mar. 23	1,412	WOODHOUSE AND RAWSON	Half-silvered glow lamp.
June 5	2,642	W. E. AYRTON & J. PERRY	Pendulum meter.

"The Electrician" *is the leading English Electrical Journal, and numbers among its Subscribers and Advertisers all the great Electrical firms.*

Its columns contain from week to week important original Series of Papers on Electrical subjects, written by eminent Electrical Experts, and fully illustrated.

"The Electrician" *is owned by gentlemen well known in the Electrical World, having absolutely no financial or professional interest in any electrical schemes whatever. Its opinions on matters of concern to the Profession are, therefore, unbiassed and of value.*

"The Electrician" *has a larger circulation* (GUARANTEED) *than any other English Electrical Journal, and offers exceptional facilities to Advertisers for reaching the entire Electrical and Allied Trades throughout the world.*

"ELECTRICIAN" SERIES, THE, of Electrical and Scientific Books (all fully illustrated), published at the Offices of "THE ELECTRICIAN," 1, 2, and 3, Salisbury-ct, Fleet-st, London, E.C. The Series at present comprises the following:—

"The Electrician" Electrical Trades' Directory and Handbook. Published yearly at the end of January. Established 1883. A very valuable advertising medium. Subscription price 5s., postage 9d. extra; after date of publication 7s. 6d., postage 9d. extra. Postage abroad, 1s. 4d. *Digest of Contents sent free on application*

Electromagnetic Theory. Vol. I. By Oliver Heaviside. Price 12s. 6d., post free 13s.

The Alternate Current Transformer in Theory and Practice. By Prof. J. A. Fleming, M.A., D.Sc.

VOL. I.—THE INDUCTION OF ELECTRIC CURRENTS. Price 7s. 6d., post free 8s.

VOL. II.—THE UTILISATION OF INDUCED CURRENTS. Price 12s. 6d., post free 13s.

Magnetic Induction in Iron and other Metals. By Prof. J. A. Ewing, M.A., B.Sc., F.R.S., F.R.S.E. Price 10s. 6d., post free 11s.

A German Edition is also published, price 8s. 6d., post free 9s.

A Pocket Book of Electrical Engineering Formulæ. By W. Gelpel and H. M. Kilgour. Price 7s. 6d. nett, post free 7s. 9d.—Large paper edition, 12s. 6d., post free 13s.

The Art of Electrolytic Separation of Metals. By Dr. G. Gore, LL.D., F.R.S. Price 10s. 6d., post free.

Electro-Chemistry. By Dr. G. Gore, LL.D., F.R.S. Second Edition. Price 2s., post free.

Practical Notes for Electrical Students. By A. E. Kennelly and H. D. Wilkinson, M.I.E.E. Price 6s. 6d., post free.

The Incandescent Lamp and its Manufacture. By Gilbert S. Ram. Price 7s. 6d., post free.

Drum Armature Winding, and Commutators: In Theory and Practice. By F. Marten Weymouth. Price 7s. 6d., post free.

"The Electrician" Primers. In 2 vols. (consisting of 38 Primers in all). Vol. I., THEORY; Vol. II., PRACTICE. Price, each volume: Paper covers, 2s., post free 2s. 2d.; cloth, 2s. 6d., post free, 2s. 9d. Or single Primers, 3d. each, post free 3½d.

The Manufacture of Electric Light Carbons. A Practical Guide to the Establishment of a Carbon Manufactory. Price 1s. 6d., post free.

A Digest of the Law of Electric Lighting and other Subjects. By A. C. Curtis-Hayward, B.A. Price 2s. 6d., post free.

The Steam-Engine Indicator and Indicator Diagrams. Edited by W. W. Beaumont, M.I.C.E., M.I.M.E., &c. Price 3s. 6d., post free.

Electric Motive Power. By A. T. Snell. [*Nearly ready.*

Motive Power and Gearing. By E. Tremlett Carter. [*Nearly ready.*

Submarine Cable Laying and Repairing. By H. D. Wilkinson. [*In preparation.*

Practical Magnetism. By J. A. Kingdon. [*In preparation.*

[Postage of the above books abroad, 10 per cent. extra.]

For further particulars and list of works published by "THE ELECTRICIAN" PRINTING AND PUBLISHING COMPANY, LIMITED, *see pages 25 to 38. Prospectus and Catalogues post free on application.*

The Phosphor Bronze Co.,

LIMITED.

FOUNDRY AND OFFICE:

87, SUMNER STREET, SOUTHWARK, LONDON, S.E.

And at Birmingham, Etruria, &c.

Sole Makers of the renowned

"COG WHEEL" and "VULCAN" Brands of

'PHOSPHOR BRONZE'

ALLOYS,

The best and most durable Metal for Bearings, Bushes, and parts of Machinery exposed to friction and wear. To avoid error or imposture, please specify the Manufacture of the **PHOSPHOR BRONZE COMPANY, LIMITED**, London. For particulars see Pamphlet.

WEILLER'S PATENT

SILICIUM BRONZE

AND SILICIUM COPPER WIRE,

For OVERHEAD TELEPHONE, TELEGRAPH, and ELECTRIC LIGHT LINES.

HIGH CONDUCTIVITY with great tensile strength.

Sole Proprietors of the Patents for the United Kingdom, India, and all British Colonies.

BEWARE OF SPURIOUS IMITATIONS UNDER SIMILAR TITLES.

ROLLED AND DRAWN PHOSPHOR BRONZE.

High Conductivity Copper Wire, German Silver, &c.

BULL'S METAL INGOTS, CASTINGS, RODS, FORGINGS, STAMPINGS, AND SHEETS.

BABBITT METAL, "VULCAN" BRAND.

PLASTIC METAL, "COG WHEEL" BRAND. NOS. I. AND II. WHITE BRASS.

PHOSPHOR TIN AND PHOSPHOR COPPER, "COG WHEEL" BRAND.

TRADE **GONDA** MARK.

The Standard Open Circuit Batteries of the World.

The Batteries manufactured under this celebrated and world-wide Trade-Mark have always maintained an unquestioned superiority to all others. They are the best for Telephones, Call-Bells, Burglar Alarms, Annunciators, Electric Clocks, Medical Use, &c., &c.

BE SURE that every Cell bears the Trade-Mark "GONDA."

The Electrical and General Engineering College,

PENYWERN HOUSE,

2 and 4, Penywern Road, Earl's Court, London, S.W.

Principal—G. W. de TUNZELMANN, B.Sc., M.I.E.E.

Senior Instructor—C. CAPITO, M.I.E.E., M.I.M.E.

Telegrams: "TUNZELMANN LONDON."

The object of the College is to train students intending to become Electrical, Mechanical, Civil or Mining Engineers in the general scientific principles which form the foundation of their future profession, in the application of these principles to practical purposes; in the construction and use of standard and commercial measuring instruments, tools, and general workshop appliances; in the practical management and maintenance of steam machinery; and in the construction, installation, and management of the plant employed in electric lighting and the electric transmission of power.

The instruction is given by means of Practical Work in the Drawing Office, Laboratories, Testing-rooms, Engine and Dynamo-room, and Workshops, with individual tutorial supervision and assistance, supplemented by Lectures.

The College possesses extensive Physical and Chemical Laboratories and Electrical Testing Rooms, containing a very complete collection of apparatus of the best British and Foreign types; Dynamos of various types up to about 15-H.P., Engine-room and Boiler-house, Carpentering and Pattern Shops, Forge and Engineering Shop, containing heavy machine tools driven by electro-motors, in addition to treadle lathes and light tools.

The College is recommended by between forty and fifty leading engineers and engineering firms, public institutions and scientific authorities. A full list of these is kept at the office, where it is open to inspection.

THE FOWLER-WARING CABLES COMPANY, LIMITED,

VICTORIA MANSIONS, 32, VICTORIA STREET, LONDON, S.W.,

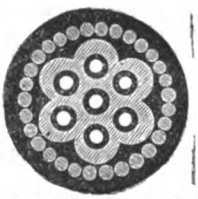
Manufacturers of all classes of VULCANISED & PURE INDIA-RUBBER WIRES & CABLES.

SOLE MANUFACTURERS OF

LEAD-COVERED CABLES

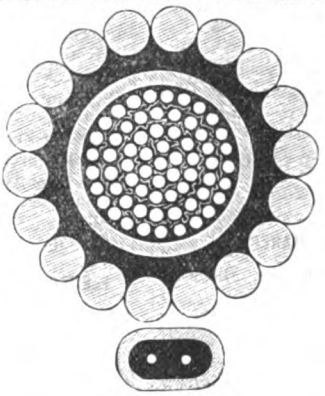
Under the Co.'s Patents for TELEPHONE, TELEGRAPH, ELECTRIC LIGHT, TRANSMISSION of POWER, and UNDERGROUND INSTALLATIONS of EVERY KIND.

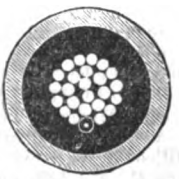
SPECIAL ANTI-INDUCTION TELEPHONE CABLES.



UNAFFECTED BY HEAT.
MECHANICAL STRENGTH.
HIGH INSULATION.
LOW CAPACITY.

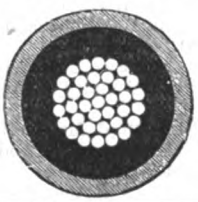
GOLD MEDAL PARIS EXHIBITION.

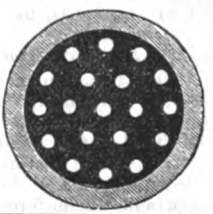




STEAMSHIPS. DOCKS.
CHEMICAL WORKS.
FACTORIES. MINES.
DAMP PLACES, &c.

References and particulars on application.





Works:
NORTH WOOLWICH, E.

Telephones { WORKS, 5091. OFFICES, 3180.

CONNOLLY BROTHERS,

BLACKLEY VALE MILLS, BLACKLEY,

MANCHESTER,

Electrical Engineers and Manufacturers of every description of Insulating Materials and

INSULATED WIRES & CABLES.

Specialities :

Vulcanised India-Rubber Covered Cables and Mains, Vulcanised India-Rubber Covered Wires and Flexibles, Insulating Tapes and Jointing Materials, Fine Braided Dynamo Wire.

We carry out every process from the raw materials on our premises.

WE GUARANTEE when requested the efficiency of our Cables for a long term of years.

SEND FOR PRICE LISTS.

CROMPTON & CO.

LIMITED,

SHOW ROOMS

148, BROMPTON RD., LONDON, S.W.

MANUFACTURERS OF

ELECTRICAL COOKING AND HEATING APPARATUS.

(CROMPTON AND DOWSING'S PATENTS).

The ELECTRIC OVEN is the Most Perfect Cooking Apparatus made.

DIPLOMA, GOLD MEDAL, AND HIGHEST AWARDS, LONDON, 1893.

No Fire. — Absolutely Safe.

No Smoke. — Absolutely Pure.

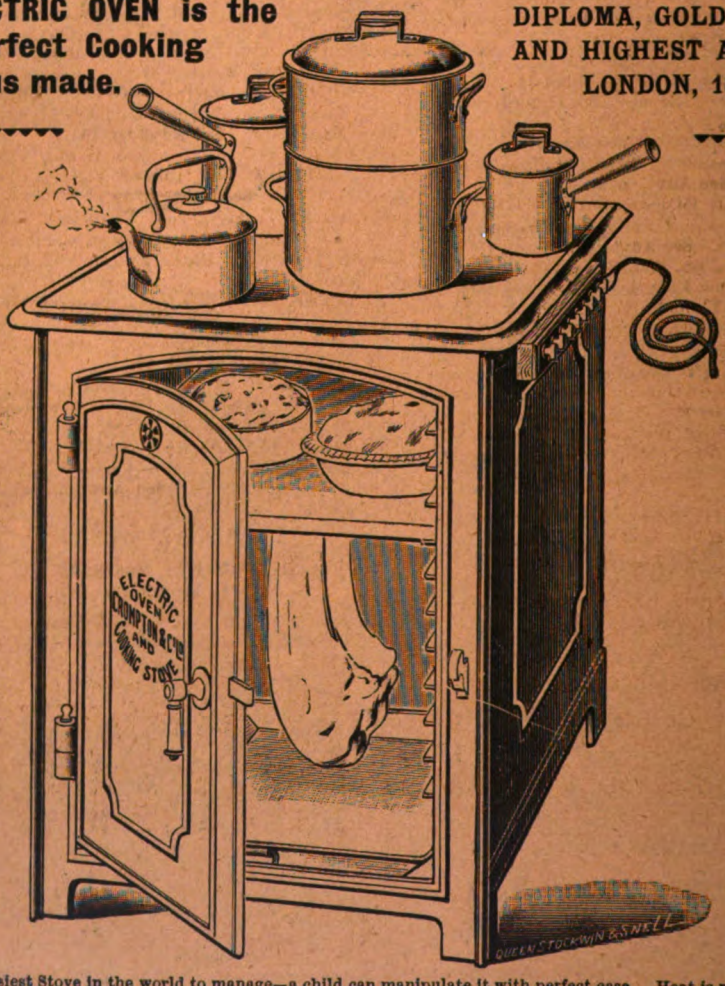
No Smell. — Absolutely Clean.

No Combustion. — Absolutely Free from Danger.

No Foul Gases. — Absolutely Best System of Cooking.

No Chimney. — Absolutely Free from Burning.

No Explosion. — Absolutely Perfect.



It is the easiest Stove in the world to manage—a child can manipulate it with perfect ease. Heat is radiated **from all sides** and top and bottom. It can be turned off and on at pleasure. The Oven will cook for a considerable time after the current is turned off. *PRICES AND ALL PARTICULARS ON APPLICATION.*

NOTE.—Electric Supply Companies are now purchasing these Ovens to let out to their Customers.

Telephone No. 6770. Telegraph Address: "SECOHM, LONDON."

NALDER BROS. & CO.

Electrical & Mechanical Engineers & Scientific Instrument Makers,

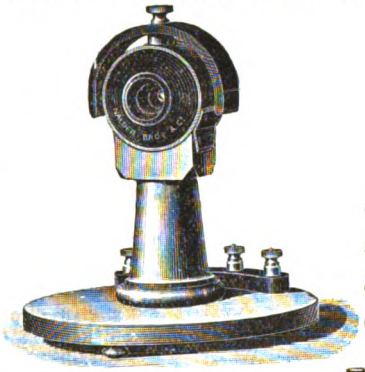
CONTRACTORS TO H.M. GOVERNMENT,

Manufacturers of all kinds of ELECTRICAL TESTING, TELEGRAPH and ELECTRIC LIGHTING INSTRUMENTS.

ILLUSTRATED PRICE LISTS FORWARDED ON APPLICATION.

Large STOCK kept of

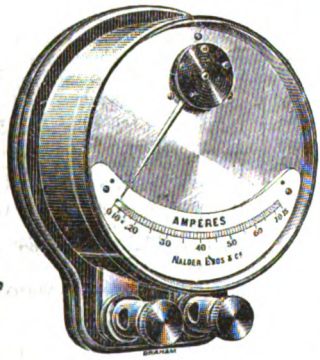
Resistance Coils.
Lord Kelvin's Reflecting Galvanometers and all other types.
Condensers and Standard Cells.
Standards of Self-Induction.

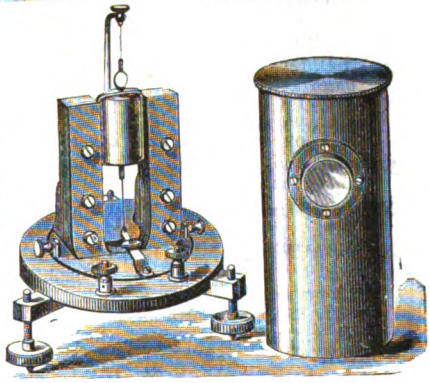


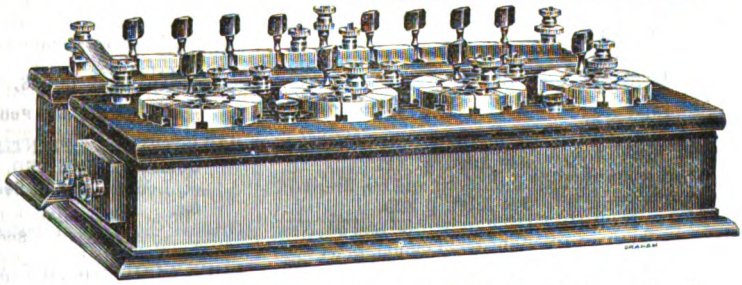
Large STOCK kept of

Ammeters.
Voltmeters.
Alternating Current Ammeters.
Switchboards.
Fuse Boards.
Distribution Boards.
Promptly made to order.
Gauges and Measuring Machines.

GOLD MEDAL CRYSTAL PALACE EXHIBITION, 1892.







Sole Makers of Ayrton & Perry's Secohmmeters and Variable Standards of Self-Induction, and Ewing's Magnetic Curve Tracers.

WORKS AND OFFICES:

16, Red Lion Street, Clerkenwell, London, E.C.

ELLIOTT BROTHERS,

101 and 102, ST. MARTIN'S LANE,

LONDON, W.C.

TELEGRAPH ENGINEERS

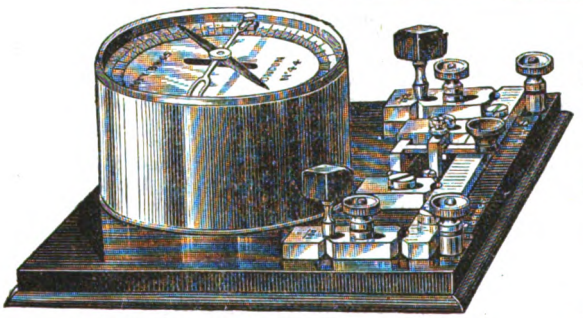
AND MANUFACTURERS OF ALL KINDS OF

Electrical Testing and Telegraph Instruments,

WHEATSTONE'S FAST-SPEED AUTOMATIC INSTRUMENTS

DUPLEX AND SIMPLEX REPEATER BOARDS.

(ELLIOTT BROTHERS fitted up the Duplex Wheatstone Apparatus for the Eastern Telegraph Co., working with great success from London to Marseilles direct, repeating at Paris and Lyons.)



DIFFERENTIAL GALVANOMETER.

SOLE MAKERS OF

WILLIS & ROBINSON'S

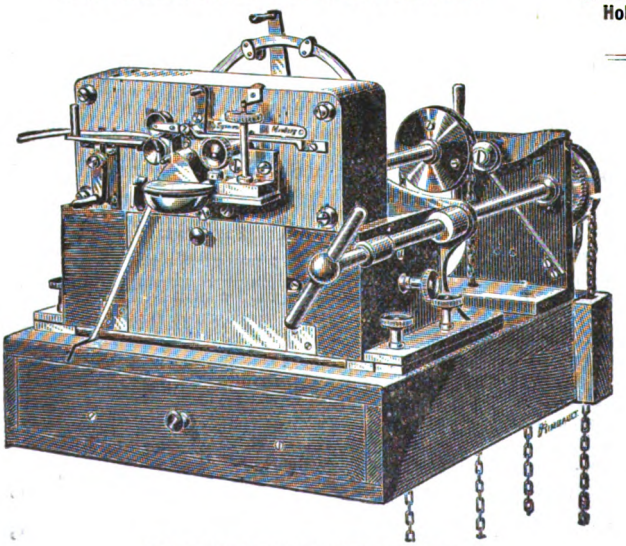
Patent Electrical Engine-Room Revolution, Steering, and Range Telegraphs.

Spratt's Patent Electrical Speed and Direction Indicators.

FISKE'S PATENT ELECTRICAL RANGE AND POSITION FINDER.

IN USE BY THE FOLLOWING GOVERNMENTS:

Great Britain, United States, France, Holland, Italy, Norway, Denmark, China, Chili.



WHEATSTONE RECEIVER.

GOLD MEDAL
PARIS ELECTRICAL
EXHIBITION, 1881.

HIGHEST AWARD
PARIS EXHIBITION,
1889.
Only "Grand Prix" to
any English
Electrical Exhibit.

Telegraph Address:
"OHM LONDON."

Telephone No. 3852.
